Subject: WWV

One source of historical info about WWV / WWVH is the book "Achievement in Radio", by Wilbert F Snyder and Charles L Bragaw, available from the US Govt Printing Office (for maybe $55). I would think that the U Texas library might have a copy. It is an 842-page history of radio activities at NBS up through the mid-1970s. The section about WWV starts on page 263 and runs about 30 pages. If you absolutely can't turn up a copy of the book, I suppose I could copy the pages. This story isn't technical, or at least not very technical. Contacting somebody like Roger Beehler at NIST/Boulder, might lead you to more technical info. Note that the name was changed from NBS to National Institute of Standards and Technology about a year ago - congressmen at work.
73, Bob W3OTC

Dig out you copy of the Amateur Radio Handbook or most any other handbook of radio and someplace you will find a list of the "INTERNATIONAL Q-SIGNALS". And, yes, they are still in use on the 'outmoded' mode of CW!   Also there is another type of signals used on CW by the U.S. Military forces "Z-SIGNALS"

I have been asked via email to post the article, so here it is in full. This article is being reproduced without permission from the Worcester Telegram, Sunday, March 18th issue (ps, I fixed the misspelled name):

RADIO HAMS CAN BE BIG HELP IN TIME OF NEED

The Montachusett Amateur Radio Association is there when you need it. The 75 member club for amateur radio operators, popularly known as "hams," has a long history of acting as a vital communication link in time of emergency. But if you ask club members why they're involved, they'll tell you it's because amateur radio is a lot of fun.

"It's quite a hobby," declared Gerald Jubb, an association member who got his first ham license in 1934 when amateurs typically rigged up their own radio sets. "You get into it as a kid and then stay the rest of your life," Jubb added.

Local hams join the association to sharpen their skills and to share the fun of ham radio with their fellow enthusiasts. The association also gives classes so that aspiring hams can learn their craft and obtain a license to operate. Of the 19 people in the current class, four are 14 years of age or younger [Diana: two of them are my kids!], three of them girls, noted Charles Cayen, the chairman of the club's membership committee.

FORMS OF COMMUNICATION

Hams can use a variety of formats to communicate, including voice, Morse Code, teletype and computer. Many hams have handheld units and others broadcast from mobile units in their cars.

Some operators, said Bill Wornham, get into the hobby to "chew the fat with anybody and everybody." Some are particularly interested in foreign contact, while others prefer getting involved in the technology of radio such as using computers and satellites. The first non-government satellite ever launched back in 1961 was for radio amateurs across the world and 12 more have been launched since then, said Jubb.

But it may be the public service and emergency functions that make ham operators and the club particularly recognizable. The association helps ensure the safety of participants in local bicycle and foot races as well as walkathons by providing communications along the routes and promptly directing help to trouble spots.

DISASTER HELP

And when all other communications fail, such as during a flood, earthquake or hurricane, amateur radio operators are there to help coordinate disaster relief and get messages in and out of the affected area. During last October's quake in California, amateur radio operators passed 15,000 messages between the stricken area and the outside, mostly to family members concerned about the fate of their loved ones, said club member Wornham. Hams passed the same number of messages down to the Caribbean when Hurricane Hugo ripped through the islands last year, he added.

Wornham sent one inquiry to Puerto Rico for a co-worker who wanted to find out if her family was safe. She got a message the next day from an operator who telephoned her from Kentucky. Everybody was fine. Montachusett Amateur Radio Association members are also ready to spring to action when local emergencies arise. The association counts among its members Wornham, who is the Civil Defense director in Townsend, and Cayen, who acts as the northeast coordinator in Worcester County for the Amateur Radio Emergency Service, the volunteer agency that would coordinate ham efforts during an emergency.

Cayen remembers a few years ago, during a flood warning in the Fitchburg area, that volunteer hams went out periodically to measure water levels which they passed on to officials who were monitoring the situation. Hams are also called upon to report local road conditions during a snowstorm or weather conditions in their town during a tornado watch.

Jubb has been a ham since the 1930s when radio captured his imagination and he began building sets to send and receive messages. He made his first radio contact with a Springfield amateur in 1933 and he's been at it ever since. Jubb makes his contacts out of the same room where he began, in a converted closet in a 250-year-old house that was built by his family.

The association has its roots in the Fitchburg Radio Club which began in the 30s, Jubb recalled. In the 1970s, the Fitchburg Club merged with an informal group of operators to form the Montachusett Amateur Radio Club. The name was eventually amended to association.

In addition to offering classes, the club participates in the annual field day sponsored by the American Radio Relay League, the national association of ham radio operators. A sort of national disaster drill, the field day gives clubs across the country a chance to operate under emergency conditions and have their performance rated.

```
The club meets every second Wednesday, except in July and August.

Check out Title 47 CFR, in either part 90 or 95. (It's in with CB under the heading "Personal Radio Services".) It is FM, with a few channel pairs around 463/468 MHz. Repeaters are allowed within certain constraints, and buisness communications are allowed. If you'd like more information, please give me a call or E-Mail me directly. PS - How's Winchester this time of year? I grew up in Ashland, just north of Richmond. Are the apple blossoms out yet? Heard any good concerts at the conservatory? You're making me homesick!

I heard a sales rep for a cellular phone company giving a pitch in a
```

shopping mall one day. The person he was pitching to asked about scanners. He told them, "scanners can't pick up this signal, it's distributed by SATELLITE and we use special encoding on it." I actually could not contain myself and burst out laughing, much to my fiance's chagrin :-). The rep gave me The Mean Face so I just walked on. Oh well.

That is just out-and-out fraud. Someone needs to deal with that.

Just my 2/100 dollars worth.

Fasinating! I suppose you talk MUCH more slowly than the average person.
Normal conversational speech is 120 wpm. I also must assume you never
work the weak ones or operate when there is QRM or QRN since you NEVER
ask for a repeat.

From personal traffic handling experience on both phone and cw nets
during the Vietnam era, I can say confidently that we passed MUCH
more traffic by voice than cw. Course we used the hi-tech of the
era, tape recorders for both out going and in coming traffic. Crisp
operating technique was a greater factor than mode, but the higher
speed of voice sure helped.

>
> I have heard him and listened with upraised eyebrow on many, many occasions. First off, I have heard him say that anyone who runs under 250 watts is an "insect" whodeserves to be squashed by the 1KW flyswatter.
>
> Yes. I think he acts like a real jerk. Sure, I'd love to have a QSL card from Belize, but since his royal behindness deigns to not lower himself to QSO with "insects", I can get nice QSL's elsewhere, thank you.

I promised myself not to get involved in this discussion, but what the hey.

As I said in an unrelated previous posting about DX stations in general, V31BB is just a guy with a radio, the same as every other guy on the band. No better. No worse. Yet he seems to get people stirred up just as a guy who was on the bands a few years ago: Mike, WA4D, aka "The Dawg."

I don't see V31BB as being much different from those "phone in and be abused" type talk-radio shows where the DJ sits around and harangues the callers. The funny thing is that people sit around and listen to this stuff for hours and let themselves get all steamed.

Why do people let themselves do this?? The answer must be that they enjoy letting themselves get angry!

The following analogy is not for those individuals who are getting angry for the thrill or the "rush" or the high of "letting yourself go" by becoming enraged. It is for those people who are really upset and find themselves taking this stuff personally: I don't mean to suggest V31BB is a raving lunatic, but ... If you met a raving lunatic out on the street (for instance, a religious zealot who is shouting at everybody who walks by, telling them they will burn in hell), would you A) attempt to shout the madman down, or B) Run away! Run away! If you answer B (like me), then why are you so distressed by V31BB?

The good news is that most of the people on the street are pretty much minding their own business, just like most of the people on the ham bands.

> Duane Mantick
> WB9OMC, a "25 watts on 10-meters" insect (according to V31BB, anyway)

Of course it's hard to determine inflection and so forth from written text, but the insect thing is really pretty funny. Lots of humor is based on absurdity. I'm 99.9% percent sure that Duane Mantick put this in his signature because he thinks it is funny, not because he considers it an evaluation of his worth as a human being.

It seems that you anti-CW logic can be applied to ham radio in general. I suggest
that if use your underlying premises that we could make an argument for turning
all the amateur radio bands into Citizen's bands. Perhaps you might wish to
expound on this topic for awhile!
As I have said before if your really wish to use voice pick up the land line.

Yes, stop by 1UP10, 15E, assuming you are in Fort Collins. (Just try and get this information from YA-HOO.) I'll even sell a 212 service manual.

Now what I really wanted to say. Sell it and by an ICOM-228A.
I'm much happier. The ICOM service people were much more reasonable
to deal with and the radio isn't such a lame duck (one of a kind).

I speak for me. I have had bad experiences with YA-HOO and will never, ever buy their equipment again.

I have seen references to an FM Citizen's Band radio service refered to as
the GMRS or maybe the GRMS service.  This seems not to be the 11 meter
Citizen's Band Radio Service, as that is limited to AM and SSB.

I don't think this is a part 15 type service either, can anyone shed any
light on what it is I keep seeing references to?

     I called NBS/NTIS (301-975-3058) and asked for this.  Apparantly
that document is out of date; the replacement is NBS Special Publication
432.  The very nice woman I spoke to offered to send me one.  She was so
nice and so efficient on the phone, it was hard to believe I was actually
talking to somebody at a government agency (actually, I have found that
many government agencies, such as NSF and NIH, are populated by nice,
efficient people; the IRS and motor vehicles, on the other hand...)

Thanks for making my day! Although cute, this is approximately the dumbest idea I've heard all week. No personal offense intended, but I think the writer is doing a disservice to potential new hams here. I am a VE, and I have seen a few guys try to write down dots and dashes and then translate after the test was over. Not one of them ever passed. They always get balled up trying to write the last string of dots & dashes while the next letter comes at them. The result is an untelligible mess. But now I can't wait to see some guy sitting there trying to remember his 26-word mnemonic string to reconstruct his binary tree from memory!!!

Let's relegate this myth about how some people CANNOT learn code to the same scrap heap that I hope most of us have used to discard the notion that some people CANNOT learn math. When people supposedly competent in a particular skill pass around the myth that some people are absent the capability of learning that skill, we give them a crutch that turns into a disabling handicap. Witness the whining over the code requirement that occupies about half the bandwidth of this forum. It comes from the same group that thinks they should get 3 hours credit for a full semester course in C.

Ok here is my 2 cents also, have one of their tuners that fried a pot (probably my fault, new rig & new ham) returned it and they took my word for it that it was still in warranty (sp? it was). They fixed it and i now have over a year on it. My opinion - it does the job, the price is fair & the service is gud.

Jay, you're living up to both your monicker and your tag line again.
You are deliberately distorting the attitude of HAMLICEN participants.
None of us are "anti-code" - just against requiring it for all license
exams for VHF-only licenses. <sigh>

With all do respect, the NTS traffic nets on CW are quite active and important. Packet networks will no doubt change that but they have not yet.

Hm... I'm amazed by all of the garbage about MFJ. I have been using a Versa Tuner III for about 6 years now and it has never given out. The same goes for my 1274B.

Just because MFJ isn't a "big-name" company and doesn't package or advertise its products in a very slick manner doesn't mean that it's not a good brand. At least some of their stuff is made in the US!

Paul
  HR seems to have more consistent technical representation but like
the other mags is subject to the "NiCad battery charger syndrome"
(actually this month in HR it was a NiCad *dis*charger). QEX is Paul
Rinaldo's (w4ri) baby and has been struggling since most of the
solid technical authors don't want to publish there due to the lack of
circulation. QST pages seem to be at a premium and there is a tremendous
battle over them, you can see which priorities win. HR and CQ
(which generally seems non-technical) do seem to have the better
international coverage and availability.
  I've chosen HR for my last few articles because of their willingness
to publish and international availablility.
  I think the bottom line is that the magazines tend to try to appeal
to the lowest common denominator for sales and aren't especially
interested in technical articles, per se.
  I'm afraid they are suffering from the same problem as the
hobby as a whole, a general lack of relevance to the information age.

BTW, what's your qth? It looks like we are pretty close.

I e-mailed this but optilink doesn't recognize you!

::
::CW is one skill that is in the potentially useful category. It is not
::a "totally useless" skill. Witness the fact that most repeaters/ and beacons
::ID with it. Along with is heavy use in ship-to-shore/satellite communications.
::An "archaic and useless" skill? I don't think so. You can't get away from
::CW -- on any of the ham bands.
::
::Irregardless, I'm not interested in cramming CW down anyone's throat, just
::in keeping the door open, something that I think the 5wpm test does well.
::Most of you must have realized that you don't really have to "know" CW
::to pass the multiple guess test at the VEC. In fact, I think all that it
::can be said the 5wpm test "guarantees" is that you can tell dots from dashes,
::keeping your options open to learn CW if it appeals to you.
::
::I really can't see how anyone can be against such an innocuous little 5wpm
::test -- especially in its current multiple guess incarnation.

It is my impression that *most* countries do not require 20 WPM for a class of license. If memory serves me right, the UK requires 12, other countries require 7 or 8 tops. Why, then, do we go through the foolishness of requiring 20?

Perhaps Don has hit the nail on the head. Let's petition that the code requirement for *all* licenses be dropped to 5 WPM (or 8 - 10 if you want to stretch it a bit), and then let's ask that the theory exams stress the type of stuff that people really need to know on the air.

I'd be interested in this as well. Additionally, I'd like to get my
hands on a decent packet/rtty/etc and logging programs that run under
Unix/Xenix.

VP/ix is ok, but I'd much rather run them in "native" mode.

The local (Phoenix) police and fire use some packet-like mode to communicate
with computers in the vehicles, and my PK-232 signal analysis mode is unable
to figure it out. I've also tried quite a few combinations manually, to no
avail.

Sounds like about 2400 baud, and it's bursty like packet.

If anyone else figured out what formats commercial systems use, could you
please post them or email them.

Thanks

Nobody is anti-CW. Nobody wants to abolish CW anywhere on any band. The
only thing anyone want to do away with is making code proficiency the sine
qua non on VHF and up.

You may now join the growing list of people who totally missed the point to
the discussion.

1. The argument about the requirements for admission or graduation in college is not a good one. There are a lot of colleges around that have different and/or fewer such requirements. If you don't like the requirements at the one you are now in, transfer. If you can't get in this one, apply to that one. In education you do have a choice. If you have a problem with the lesser reputation of the schools that don't require calculus, english, and foreign languages, then I suggest you think about WHY the better schools have their reputations. If you were an employer, which school would YOU hire graduates of?

2. In Amateur radio you don't have much of a choice. CB doesn't get you anywhere (it's equivalent to the choice of NOT attending school). That's not to say that CB'ers are bad; I know some CB'ers who are good people. To get a ham radio license, you must pass certain tests; there is no alternative.

3. Knowing Morse Code does not improve one's operating skills on VHF frequencies anywhere near what it did many years ago on HF. Code is still popular on HF, and you would be a more rounded operator if you do know code when operating HF. But we (no coders) are talking about VHF (see #4) and above.

4. Most HF bands are now OVERCROWDED. Most VHF/UHF/SHF bands are way under occupied. Only 2 meters appears to have some significant usage in many parts of the country, but no where near that of the big 5 HF bands. The other "centimeter" bands are very sparsely occupied if at all. The numbers are needed on VHF/UHF/SHF and not on HF. We would not have this problem (and would not need a no code license class) if half the HF operators would start doing their primary operating on 220 Mhz and above. Come on guys, move on up in the world.

5. It used to be of benefit to THE PUBLIC to encourage knowing the Morse Code operating skill, because there was a demand for such radio operaters in various other services such as Maritime and Military. These demands and being phased out in favor of computer operating skills, which is what we should be encouraging next. The very reason for having a CW test in the earlier days of ham radio can be applied to require a COMPUTER TEST today (but we won't go so far). Just ask the DoD what they need.

First of all, I reformatted your message since the first 4 lines above were actually typed in a one big long line, which also means the people getting your message via INFO-HAMS lost much of it. The lines need to be kept under 80 columns for some parts of the network.

Ham radio is something entirely different from the land line. Would you still say "pick up the land line" if it went dead, or was overloaded, or the computers running it crash (again)?

CB is a "land mobile" type service intended for letting ordinary people have access to communications while mobile. With today's cellular phones, CB could not be justified if it were being created today.

Ham radio and CB a very different. People do not do technical experimentation on CB (legally). Ham bands are for that. At least here in the US we at least pay some lip service in the rules to the ideas of advancing the state of the art. Some of us are trying to re-establish ham radio's FIRST tradition of invention and creation.

If these were commercial antennas, I would advise you to contact the manufacturer. They should have this information.

Since these antennas are probably home-made, I would recommend that you check out some of the articles published in the literature. You should be able to find two or three good articles in Ham Radio Magazine, from the middle 80's. Unfortunately, my mags are 2600 miles away, so I can't give you a better reference.

You didn't say if you wanted to stack them in the E-plane or the H-plane.

More info about stacking antennas:

The stacking distance strongly depends upon the gain of the antennas.

You also didn't specify what you were looking for. Do you want maximum gain? Do you want a clean pattern? In which plane?

In general, I usually recommend stacking at just a short distance less than the max_gain_distance. This will reduce the gain only marginally, but clean up the pattern significantly. Sorry, but my literature is 2600 miles away, so I can't give any quantitative information.

It looks like this is a good place to post this message.

I am quite interested in getting into ham.

I have been CB'ing for a while and have grown real bored of it...I then got into "bootlegging" the dx'ing with an out of frequency radio, and now have decided to get into ham.

The only problem is, I have no idea even where to start...I was wondering if anyone out there on the Canadian side (no offence, but I think Canada is different than the U.S.A) that could offer some information to me.

Just the basic stuff, such as what it takes to become the Class C Novice and what band restrictions there are etc...

Thanks in advance...

Dave (DR70)

What does the thing look like? Can you identify what kind of antenna
it is? Do they mention specific purported gain figures? I'm curious
what this is that makes it so good.

...could I build one easily myself...?

ARF GUESTS

On Mar 29, our guest on the Amateur Radio forum will be Jay Miller from the ACLU. In addition to discussing the ACLU in general, the main topic will be legalization of drugs.

On Apr 05, our guest will be Jerry Levin, former hostage and CNN bureau chief. Jerry's experiences as a hostage and his criticism of American policy concerning hostages will be discussed.

Our guest last week was Wayne Heimbach from Amnesty International. AI's position on the death penalty generated a very spirited debate.

> Welcome to my fog......  I guess?!"
```

The service in question in GMRS or General Mobile Radio Service. There are a limited number (8-10) of channels in the 462 Mhz band. Some are repeater pairs, some are simplex. Both personal and business communications are allowed, however only an individual can be licensed (due to overcrowding by business users). Existing business licence holders can stay until their licence expires, however no new business licenses will be issued.

There is an address to write for more information, however I do not Have it available. I am also looking for more information on GMRS, so post away.

I have been trying to find some one who has a schematic of the Regency HR-2B that would be willing to make me a copy. I called Regency and they have sold the ham gear to a company called ESI. I called them and they will only sell me the complete service manual for $15. I really don't wish to double my investment in this radio so if anyone would be willing to make a copy of just the schematic I would gladly pay costs & postage. I had another person contact me wanting the same thing and I will pass it on if I receive any response. Thanks,

Hmmm. Nice to see a fellow UHF guy on the net, almost within reach without having to use the moon ...

Lets see, 3m boom is somewhat more than 4 wavelengths. The antennae thus are quite long.
The usual recommendation if optimizing for gain is 2-2.5 wavelengths which means 1.4 - 2 metres apart. Omtimizing for space (communication) suggests smaller spacing in order to minimize the backlobe. I somewhere saw 0.8-1 wavelength.

See you on 70
Chris.

Can anyone suggest sources for a down converter for GOES reception ?
Maybe there is a do-it-yourself kit or circuit available ? I currently intercept the GOES photos from 8080 Norfolk WX and haven't found other sources. I would like to receive wirephotos, but I am unable to locate a frequency for this that is active. I am located in New England.
Thanks in advance for your comments.

What you are hearing is "commercial packet" It is in MMP protocol. Even if you could capture the bits with your TNC you would spend the next three lifetimes decoding the packet. Security is top on the list when it comes to public safety. MMP is a proprietary Mobile Data International protocol.

Radiokit, P.O. BOx 973, Pelham, NH 03076. I don't have their phone number handy. If you ask directory assistance, ask for Londonderry. That's where they are located, though the P.O.Box is still in Pelham.

I am neither an expert nor a lawyer, but would it be possible to have a friend take notes? Specifically, a friend who:

- Does not hear the code (i.e. headphones on the exam-taker) and
- Does not know Morse Code

Then the question becomes, is it permissible to take audible notes (talking while head-copying). Perhaps into a tape recorder, but then replay might be more difficult.

I don't know the legalities of this method, but I do know someone (my sister) who was allowed to take the SAT test with a (much younger, and therefore presumed less knowledgeable) brother filling out the form because of some reason she couldn't (I think a broken arm).

A slightly-off-the-topic question -- what about the requirement to send?

- Skip   KK6HK

About a week ago, someone noted, while discussing thenon-existent FCC proposal to "tax" modem users on phone lines, that the telco's are still interested in such a proposal because transmission of modem data occupies a full 64 kbps "channel" while voice can be combined. I don't know what kind of carrier system he might be referring to, but at "baseband" levels, the standard system is the DS-1 channel bank that multiplexes into a T-1 data stream at 1.544 mbps. Each individual voice channel is converted from analog to digital by sampling at 8 kilosamples per second, then coded into 8 bits per sample. Thus, a 64 kbps datastream is created from ONE VOICE CHANNEL. If your modem is operated over a standard voice grade telephone line, and your local telco uses digital switches, your modem signal will also be converted into a 64 kbps data stream. There is no difference as far as the switching equipment is concerned.

The telco's concern is related to the amount of time that modem users spend connected through the system compared to voice users. Telephone switching centers or "Central Offices", whether analog or digital, are sized using probabilistic predictions of subscriber use. If large numbers of long connection times are expected, moretranmission paths and generally more switch capacity are required. Modem users generally stay connected longer than voice users (unless, of course, you are raising teenagers, at which point probability goes out the window), and affect the traffic flow accordingly. The telco argument is that if you are connected longer, you should pay more.

Ironically, it is the true digital channels that can be multiplexed into higher level datastreams to provide greater capacity per channel. While one voice circuit requires the full 64 kbps, up to 6 9600 bps channels could be multiplexed into the same data space.

>My quess is the continuous sweeping is some sort of OTH backscatter radar.

Once again, let us put this question to a rest. The sweeping carrier is a CHIRPSOUNDER. Used to track ionospheric conditions. There are several locations (All Military) in the world, where these sweeps are made according to a predefined schedule. The schedule itself is in the (I believe) lastest issue of Popular Communications.

In addition to reading this newsgroup, anyone with a serious interest in radio communications should subscribe to Popular Communciations (or get it at your news stand) and Monitoring Times. Glenn Hauser's two magazines are probably also very useful, though I have not managed to part with the subscription fee yet...

To the person who replied to my PockaPock posting (the funny sputtering sound I noted on 75 meters) I am quite sure that he is right, and that the sound eminates from frequency hopping radios (military). This leaves the funny BURST type (Obviously Digital) transmissions that I regularly hear on 75 meters very early in the morining. I was told that these are used in conjunction with Radio Navigation for USAF planes, though none of my friends in the USAF "will confirm nor deny".... It IS interesting to note though that on the night Norriegga was being ferried to the USA, that the well known Cuban CW jammer that trashes up the entire 75m band was out in full force, and making a shambles of 75 meters (though the cuban's fundamental is 3922, his spurs are LOUD on 3950, which also happens to be where I often copy the one second digital bursts (they are NOT any type of signal I am familiar with, but obviously ARE digital)...

Where is HAVANA MOON to solve these mysteries... I know he reads this group......

As I understand it, the basis for the communicator, or other no-code radio licenses is to provide for those person who wish to operate in the VHF, UHF, and EHF spectrum. The idea is that thses people should be able to get a license wtihout having to take aa code test. The VHF and above sees little CW action compared to the HF bands.

I can see the point being made, but my question is this: With the novice and tech tickets being replaced by some type of a "no-code" ticket, won't that make the very bands we want populated by experimentors populated by the least experienced, least educated, radio persons?

I'm NOT supporting a code requirement, I'd just hate to see the No-code ticket be "bottom rung" of the license structure. Mainly, because I'd think we want the entrence level ticket to give the new ham a taste of as many different type of ham radio as possible.

Seems to me that we still need something where a person can get an entrence level ticket, explore all aspect of Ham radio, and learn. But, I can also see that we might need a no-code ticket for VHF and above.

How can we get both? Got me. My perspective is from a SWL who is studying to get his novice license. I'm trying to hurry up before the rules change. Right now, I get a little of everything in Ham for my novice ticket.

With the current communicator proposal, I'd have to get a general class ticket before I could operate anywhere but on VHF and above.

This is just a reminder/invitation to all college and university ARC's and any other interested parties to join in the College & University Net to be held this Saturday, March 31 at 1800Z on 28.425+-. Net control will be the Washington Univ. ARC - W0QEV. I realize that 10m is not the most ideal place for a net - we have been through that already. Let's just give it a try and see how it works, shall we? Hope to hear you on the air...

Scott

>yet.

Note that I said "nil", not "zero". I'm sure there's *some* public service traffic carried by CW, but I find it hard to believe that it's more than negligible. However, I would be open to statistics on this point.

By the way, note that I didn't limit my assertion to amateur radio; lots of radio services besides the amateur service carry public service traffic, and to my knowledge few use CW to do so. A fair comparison would include these other services, since much of the amateur use of CW for traffic handling is due more to inertia or the personal preference of the operator than to it being the best mode for the job.

I just got my 721 display upgrade in the mail (Cost: $40+$1 S&H). Installation took about half an hour using small phillips screwdriver and solder iron. Now I can see it in the bright sunlight (at least, I think I can - our usual sunny weather is cloudy today!). It has black numbers, with a yellow background - just like the TM-731.

I think Kenwood should be commended for doing this. They could have just told everyone to buy the next model (the 731), but instead they are supplying a replacement display (readable in sunlight) for an old one!

+I am considering renewing or starting subscriptions to various HAM magazines,
+and would appreciate comments or suggestions.
+My priority list goes something like this:
+1) Technical content
+2) Technical content
+3) Technical content
+4) Operating practice, band openings, etc
+...
+98) Contests
+99) Silent Keys (unless I am listed; that would concern me :-(
+
+QST, Ham Radio, and 73 Magazine are locally available, so I have a pretty
+good idea of their content... how about QEX or others I may not be aware
+of? Any good newsletters?

Well Paul, my list is similar to yours..but I notice you give a damn about chasing awards..I simply don't! My ranking:

1-98) Technical Content
99) FCC ACTIONS, NPRMS, etc

Puts QEX near the top of any list, yes, I do subscribe to QST also but tend to read it last! Ham-Radio is next, and equal in stature to the AMSAT monthly pub, 73 magazine is fun so I usually read it for the fun that Wayne pokes at the "Newington-Nerds" every month. CQ magazine is normally for, er, uhm... ..shall we call them, 'transition operators'..?! You know, CBers on the verge of finally growing up, and getting their ticket. ;-) As for the smaller, club/specialized activity-oriented pubs there are some really great ones; like the TAPR Journal, RTTY Times, DSP Picture, So Cal. ATV's rag and the like... ..then there are ones like the OLD-Old-Timer's Club, which is filled with obits, ancient tube/radio ads, notices of ex-XYLs having estate-sales (some real bargains out there!) and the nominal letters to the Editor ("..these damn kids don't know what fun IS! Packet phooey! We used to run an 813 as an oscillator on 40 meters with an antenna made from old barbed-wire on my Dad's farm back in 1930...blah, blab, blather!") and a calander of upcomming events - Yawn! The only value in this sort of junk is the letters, and the ocassional sideways editorials. Try it.

73! Erik

(as an aside: Given my druthers, it would be great if QST were to take all that damn contest garbage out of the magazine and put IT into a special pub for those that care about it..and want to pay extra for it being printed!...HINT! HINT!..then they'd have room to publish the kind of quality tech-stuff that I buy QEX for! ;-))

+   AA6KX

One minute, the question isn't about learning CW. The discussion centers around the notion that the requirement of CW skill @ 5 WPM is obsolete. You should decide for yourself, of course, but consider the matter a little more; consider these categories:

1) Keep it all as is. No new class of license. 5 WPM = Novice & Tech, 13 for General and Advanced and 20 WPM for Extra. (call this viewpoint "STATUS QUO")
-- kiss the Amateur Service goodbye! The Land Mobile guys love it!

2) Have a Communicator Class license, as proposed. No code, but with very restrictive band/power privs. (call this one NO-CODE GHETTO)
-- add 10-15 years to the timescale, THEN kiss it goodbye!

3) Have a Communicator Class license with the same band/power privs as TECH but with no HF privs. (call this one NO-CODE TECH)
-- add 20, maybe 25 years to the scenario of #1.

4) Do #3 and then ELIMINATE the requirements for CW beyond 5 WPM for all

other classes of license. Maybe make the written tougher and more comprehensive regarding Radio Science, the laws and operating conventions. (label this view THE FUTURE, and count on CW being dropped by the ITU, as a requirement for Amateur Operations at a future date!)

-- Keep The Amateur Service FOREVER!

The slant in naming is mine, and I'll admit my bias towards #4, it seems to loom on the horizon, the only thing standing in the way is an ocean of people that insist on paying lip service to an outdated notion...the notion that good communication/engineering skills are rooted in CW. It just ain't so...

Notice I said notion, not mode! I'll continue to use CW as it's appropriate to do so, but only for the sheer entertainment value of working weak signal stuff...not everyone is so easily amused! ;-)

73!

GMRS is formerly known as "class A" CB and oeprates on 8 pairs at around 462.5MHZ. The regulations section is part 95, sub part A. The FCC has recently ruled that GMRS is for personal use only and no more businesses will be granted GMRS licenses. All businesses now using GMRS will not have their licenses renewed. Any citizen may apply for a GMRS license using the business license application but there is no need to explain why you need a license, contrary to the requirements for a buiness service license, so you need not fill in that part of the form. (I forget the form # - 510?)

You can use any FM radio type-accepted under part 95 (and most that are type accepted for business radio are also accepted for part 95), including hand-helds and pagers. Repeaters are allowed on this band and may either be open or closed, depending on the owners wishes. You may use a closed repeater for a monthly rental fee of at least $20.00 a month. Radio prices range from around $100.00 for old crystal-controlled hand-helds to several hundreds for modern synthesised gear or even several thousands for scanning transceivers and other state-of-the-art goodies. If you want to use every channel, you could require as many as sixteen channels -one each of duplex and simplex.

I know this is a somewhat subjective topic, but I'm interested in people's opinions of what make & model general coverage receiver (say, 500 Khz - 30 Mhz) HF for around $1 kilobuck would be worthwhile.

We need something which will be stable enough to make tuning of SSB and RTTY reasonably easy, have bandwidths good for CW, RTTY, SSB, and AM and is a "shack" (as opposed to mobile) rig.

During times when experiments are not being run in the lab, it
could be used in conjunction with a ham station we are trying
to set up. Should be well shielded since we got a BUNCH
of electrical noisy equipment in the engineering bldg, particulary
class B computer systems.

I'm searching thru back issues of the ham mags for reviews, but
am also interested in personal opinions. Of course, I'm
considering ICOM, Kenwood, & Yesau. Any others? Digital control
would be nice, but is not critical. Would we do just as well to
go with a transiever as a straight receiver? How about the
IC735? IC751A (if I can get that much money)? R71A? TS440S/AT?
R-5000? R-2000? FRG-8800? FT-757? others?

Please E-Mail me back, since due to a disk space crisis we are
not accepting rec.* groups (sigh) (although I am getting the bitnet
gatewayed digest).

Tnx & 73's

I agree that there should be a no-code license one can get that is other than an entry level license. I also believe would should retain an entry level license as the Novice is.

There does NOT have to be one single point of entry, nor does there have to be one ultimate goal.

The 90-55 proposal stinks because it ruins ham radio and sets up a nocode system that is doomed and will reap worse sentiments among hams than was ever imagined with incentive licensing.

[all above are my opinions]

The comments are available on file at the Washington offices for examination during business hours. They are not distributed. They are public files and you may copy them if you wish. You may pay someone to go there and copy them for you. The FCC has contracted with a commercial copy contractor to provide this service. You can contact them; they are listed in each Report and Order from the FCC (see any library that receives the Federal Register).

According to the ARRL Handbook (which may or may not be the best source of this info), optimum spacing between long yagis is one wavelength- this would be the position for maximum gain. Closer spacing results in less net stacking gain, but a cleaner pattern.

According to the 22nd edition of the Radio Handbook by Bill Orr, W6SAI (which may or may not be the best source of this info- where did I just hear that? :^)), "...as a simple rule of thumb in stacking extended Yagi antennas, or other arrays having high gain, it is suggested that stacking distance be equal to 3/4 of the length of the antenna."

The numbers I have personally seen for stacking 432 antennas, seem mostly to run in the 60 inch range, for antennas such as the Cushcraft 424B which has about a 17 foot boom. This suggests a compromise between the previously mentioned references, and it may be that the gain degradation by spacing closer may not be as much of a loss as the pattern degradation by spacing them wider.

Bottom line, I'd start with about 60 inch spacing, I bet you'll be close to optimum. If your station setup allows, you can play with the spacing while measuring Sun noise when the Sun is just clear of your horizon. If you can't do that, just space them 60 inches apart and leave it- it'll be real close.

Hope this helps some.

I recently obtained a PK232 and want to use it with my 02AT on VHF. Any hints or suggestions for setting the deviation, interface cables, etc. would be appreciated. Please post to the net since other people may be interested also.

BTW, I enjoyed Phil Karn's article in QST. I hope the OF's in Newington aren't using it as their April Fool's article.

It took a while to locate and type this. The following is excerpted from articles in _The Lowdown_, April 1987. (Copy of complete articles for SASE.) _The Lowdown_ is the monthly newsletter of the Longwave Club of America, whose major interests include operation in the 1750-meter band, which is license-free with the restrictions of one watt transmitter power and 50 foot maximum antenna length.

LITZ WIRE AND 1750 METER LOADING COILS

by Mitchell Lee

Litz wire is a favorite among LF enthusiasts. It is commonly held that litz wire possesses magical properties that obsolete any other type of wire. While litz falls short of some of these claims, it can provide a significant improvement in loading-coil quality factor and transmitting efficiency. When winding a coil with litz wire it is a good idea to plan in advance as to which type to use...

Litzendraht wire was developed as a means of reducing skin effect. As the frequency of an AC current in a wire is increased, current is forced out to the surface of the wire by the magnetic field generated from the current itself. If this argument is carried to extreme, all of the current ends up flowing on the skin of the conductor and no current flows at the center. Skin effect causes the AC resistance (loss) to be greater than the DC resistance. It is even significant at frequencies as low as 60Hz, where it often enters into AC transmission line design calculations for long lines.

There are two ways to combat skin effect. One is to use a larger wire diameter so that the surface area... is relatively large. This works well at shortwave frequencies and in some cases copper tubing is used to save weight and material... Sometimes the conductor may be coated with silver to enhance the conductivity at the surface.

A second method is to break the conductor up into a bundle of many individually-insulated conductors. This is the same as paralleling many wires... Each strand is sized so that its diameter is equal to approximately 2 skin depths or less, for optimum results. Litz wire fails to be useful at frequencies above 2 MHz, as capacitance effects begin to dominate and the relative size of a single conductor with similar loss characteristics becomes small enough to be practical.

Skin depth is the thickness of conductor where the majority of AC current is concentrated. The AC resistance of a given conductor is approximately the same as the DC resistance of a hollow tube having a wall thickness equal to one skin depth. Skin depth is given by the equation

skin depth (cm) = 5033 sqrt(p/uF)   (Terman)

where p (rho) is in ohms/cm^3, and F is the frequency in Hertz. u (mu) is the relative permeability of the conductor. For copper, the formula reduces to

skin depth (inches) = 2.61 sqrt(F)

At 175 kHz, the skin depth is approximately 6.2 thousandths of an inch. If we select a wire that has a diameter of 2 skin depths #28 AWG) or less... all of it will be carrying current. If the wire is 6 skin depths in diameter, less than half of the wire will actually carry current. To minimize losses for a given diameter of finished conductor, we should use litz wire made of strands that are no larger than 2 skin depths diameter.

This is only a first-order approximation. Air space between the strands in the cable, capacitance effects, and the fact that the definition of a skin depth holds true only for a big wire, will limit the accuracy of this approximation. But, it is good enough for LF work. At 175 kHz, a cable of numerous 28 AWG strands is the largest practical size...

There is a limit on how many strands remain cost effective. If more and more strands are added into a litz wire bundle, the wires in the center begin to feel the effects of the outside strands through mutual coupling. The impedance of the wires on the inside is higher than... on the outside of the bundle...

To help improve this situation, an attempt is made to transpose the strands in a litz bundle so that each one weaves a path through the center, outside and middle, thereby equalizing the impedance of each strand. This is difficult to achieve in practice, particularly where large numbers of strands are used. The same method of transposition is used to balance the impedance of 3-phase, 60Hz high tension transmission lines. You may have noted an occasional tower with extra framework and insulators; if one looks closely he can see that the relative positions of the cables are being switched around.

If smaller individual strands are used, the losses do not necessarily go UP. Instead, the DC resistance more nearly approximates the AC loss. While a 10 AWG wire has much higher AC loss than DC loss, it is still superior to a single 44 AWG conductor. But much less copper would be used (and the overall outside diameter greatly reduced) if the 10 AWG conductor was replaced with a number of 28 AWG wires. This is because all of the copper in a 28 AWG wire does work carrying current, where only the skin (the outside .062") of the 10 AWG does any work...

[Coil construction information omitted]

Common litz wire sizes also dictate the use of a strand size no larger than 28 AWG. For instance, Kerrigan-Lewis only stocks litz of 30 AWG strands and smaller. Given the constraints discussed, 34 or 36 AWG strand size is still a good compromise. 60/36 (60 strands of #36) has the lowest practical loss for stock sizes. It is also available as 3/30/36 (3 bundles of 20 strands of #36), with no difference in loss. 175/40 is another stock size of similar low-loss characteristics, but the coupling between individual strands may degrade its AC loss.

Litz wire is available from Kerrigan-Lewis Wire Products, 4421 W. Rice Street, Chicago IL 60651 (312) 722-7208. They manufacture much of the litz wire that is used in the US. Other companies that advertize litz often buy it from Kerrigan-Lewis. If you buy some litz, make absolutely sure it is solderable. Soldereze and Nyleze are two common insulations used on litz wire. The temperature of the average soldering iron is sufficient to cause the insulation to melt and evaporate, leaving the wire exposed for soldering. Other insulations must be removed chemically-- an unnecessary inconvenience.

Keith Henney: The Radio Engineering Handbook, Third Edition, 1941, McGraw-Hill.
Fred Terman: Radio Engineers' Handbook, First Edition, 1943, McGraw-Hill. Not to be confused with the much more common and vastly inferior Fourth Edition, 1955, which bears the revised title Electronic and Radio Engineering. The 1955 edition was compiled at a time when Terman began losing interest in engineering and electronics in favor of administrative pursuits at Stanford. The fantastic coil chapter was dropped in the 1955 edition!

LITZ APPLICATION GUIDELINES

(Reprinted in _The Lowdown_ from _Design Engineering_, February 1, 1979, "Multistrand Litz Wire Adds 'Skin' to Cut AC Losses in Switching Power Supplies," by T.A.O. Gross.)

1. If your present design uses a ferrite core, you should be using Litz on the high-current windings. If Litz does not help, the choice of ferrite was wrong in the first place. Most switching chokes should be using thin silicon-steep cores or Supermendur.

2. The biggest benefit from "Litzing" a coil comes in large reactors of low impedance working between 20 to 200 kHz. The high-current windings of flyback transformers are equally good candidates.

3. Thin foils compete with Litz and offer the advantage of better space factor. The disadvantage is that losses can be high due to fringing fluxes.

4. Transformers with large air gaps have large exciting currents, which in turn produce strong perpendicular magnetic fields. Very often it will pay to put the air-gap function elsewhere - in another component - so that the fields are out of harm's way.

5. Don't use solid round wire larger than AWG 8 for anything carrying 20-kHz current. Don't use wire larger than AWG 20 in 20-kHz transformers, or AWG 28 in 20-kHz reactors.

6. Balun and transmission line transformers are the least likely projects to make you a hero by Litzing.

7. Estimate the probably Rac:Rdc for inductors, flybacks and loosely coupled transformers using the ferrite pot-core applications data for the general size of the device you are designing. Keep in mind that Rac:Rdc gets worse with increasing size and decreasing impedance.

8. If the dc component exceeds the rms ac component by an amount greater than 10 times, you can forget about every rule in this table except rule #1.

The ideal spacing is one wavelength to maximize the gain. This is 70 cm = 27.5 inches. I believe that one could also stack at multiples of one wavelength to achieve the same characteristics, but I would have to go through some calculations/computer simulations to be certain this is true.

Another important consideration is feeding the array. Both Yagi-Uda arrays need to be fed in-phase, plus you must maintain proper impedance matching at the feedpoint, as follows:

```
          Yagi #1                  Yagi #2
             ___                      ___
             \ /                      \ /
              l________________________l
         Point A          l        Point B
                          l
                          l 50 ohm feed line
                         /\
               Need to see 50 ohms looking in
```

The phase at point A = phase at point B. As far as how to do this, I believe both the ARRL antenna book and the ARRL Handbook both show methods for providing this feed mechanism (I know I've seen it in older editions). If you can't find it, email me a message (via UUCP given below) and I'll send you the details.

73's.

>
>I think Kenwood should be commended for doing this. They could have
>just told everyone to buy the next model (the 731), but instead they
>are supplying a replacement display (readable in sunlight) for
>an old one!

I have also ordered the upgrade for my 721A... However, while I am
pleased thay they are providing the display, it has taken over 6 months
from the original estimate of when it would be available. I have been calling
Kenwood every month since September to hear that it will be hear next month.

I do own a lot of Kenwood gear, but the 90-day warranty on their gear,
and passing of bad information for 6-months is not big on my list of
what I expect from a company. With this whole sequence of events it is
likely that I will consider Yeasu and ICOM for future radio needs that
I would not have done before...

Just my thought,

Phil

Thanks to Mike Butts (KC7IT) and others for locating the Jackson Bros dial drives. They are available from:

RadioKit in Londonderry, NH
603-437-2722

Mike also says they have lots of other hard-to-find parts.

73's all

In trunked systems such as Motorola's, can anyone identify the formats, etc. used on the trunking data channel? Watching the output of an AEA PK232 in ASCII mode on these channels seems to show fairly consistant patterns, etc...

As the original question-asker (What's a good technical ham radio magazine these days, anyway?), I've received numerous replys. Here is my thumbnail summary:

QST: Generally lost in the dark ages, occasional good stuff however.

QEX: Skinny, merged with Gateway (ARRL packet/digital newsletter), pretty good but could be better.

73: Low-tech, appliance operator oriented

CQ: (see 73:)

Ham Radio: Generally the best technical articles

VHF Communications: (an English translation of a German magazine) 100% technical content. Available through Timekit in Ohio.

I guess I will re-join the ARRL to get QST, subscribe to QEX and Ham Radio. _VHF_Communications_ looks interesting, I will try to locate Timekit and get it. I will let you all know if anything interesting appears.

Yes, I know that the ARRL isn't too popular these days, but I figure they at least do more good than harm for the hobby as a whole.

In article <>, glenne@hpnmdla.HP.COM (Glenn Elmore) writes:

Just so nobody gets the wrong idea, Optilink *does* recognize me (I'm not a hoax, although there are those who wish I were ;-). Glenn eventually got email to me.

I am looking for a set of manuals for a Motorola Motrac "L" series solid state receiver, part number TLD1340AFSP20, with a recieve channel element number TLN1086A. This unit was built in the late 1960s, and was retrofitted into a J74XB12101AT repeater. Please if you know where one might find a service manual, or you have one you would be willing to copy or sell, we can pay for it. We have called motorola already, and they can't find it! They know they HAD manuals for it, but they can't find them!!

Hi Netlanders,
One of the hams at this site also repairs radios on the side (no this isn't a commerical for him!). He has repaired a lot of Yaesu 727R radios(a lot being 3 or 4) in this area where the trouble was caused by loose slugs from the tuning coils. The loose slug is conductive and typically shorts out a transistor which in turn inhibits xmit on both bands. Letters to Yaesu bring no answer as to why this is happening.

If you have had a problem like this, send info to me and I will forward it to this fellow. If anything exciting comes of this I will let the net know.
   Thanks,

Hi,
I just started studying for my novice and I have a question.

Where do the Q-signals come from? What's their origin?

Why "Q" ? Someone told me it might be from French.

And also is there a way one can memorize which is which without
resorting to brute force memorization? Is there some mnemonic
way to remember these things?

I know these questions aren't very important to most of you who
know this stuff by heart, but if you find the time...

Thanx,

Jim Disbrow

Does anyone out there have a Modification for the IC-32AT that will extend it's rather limited UHF capability to include the rest of the 420-450 band. Also , is there a way to restore transmit to the lower part of 420-450?

As a follow-up, what is this Mod Server that I've heard of. Is it an ftp sight or does it require a modem?

The Delta Ameatur Radio Club here in Memphis is airing the Newline No-code National Teleconferencing Radio Network on its 2m/220 repeater W4BS.

We have already received our port assigment from Newsline. The question that we have now is whether the teleconference is two way over the phone patch or do people with questions call on a seperate line ?.

Does anybody have any suggestions ?

Richard--

I just heard about the new rules this morning, and I agree with you
that it's an encouraging development. I was also heartened to learn
that King Hussein worked some Israeli hams when he was visiting in
England a year or so ago. Perhaps Jordan will be the first of the
"banned" countries to renew amateur radio communications with Israel.

Every little bit helps...

Patty

> 1. The argument about the requirements for admission or graduation in college is not a good one. There are a lot of colleges around that have different and/or fewer such requirements. If you don't like the requirements at the one you are now in, transfer....
> 2. In Amateur radio you don't have much of a choice....

True, its our only college and hams have a big say in what goes on. So when enrollment is down, you have two choices: 1. Figure its a symptom of society and try to maintain standards of quality. 2. Figure its a symptom of problems with ham radio and try to reduce standards to get enrollment up.

The evidence seems to point to conclusion 1. Thinking hobbies are down all over the place and TV is up. If you support conclusion 2 though, you won't be alone, you'll be following the path of untold numbers of high school and college adminstrators all over the country. This is a very safe path to take. The arguments have been handed down generation to generation and usually work.

I'm not really interested in getting the best operators on the air. Or of making the most efficient use of spectrum (this is a HOBBY for christsake). I am interested in the learning aspect of ham radio and feel that it is the best intent of ham radio. Incentive licensing is a great way of tricking people into learning something potentially useful/fun. (Yes, and people need to be tricked, you're fighting the biggest trickster of all after all -- TV).

Morse code is Ham Anthropology/Archaeology 101 it is also Digital Communications 101. Its the closest you'll ever get to BEING a modem. And most of all, its a communication mode. Being apprentice communicators we should learn it. The problem is, the other newer modes are not as heavily stressed as CW. If there was more coverage (more tests?) in the other modes, there wouldn't be such complaints for the 5wpm CW test.

CW is used in 1990. Phil, you mentioned that many repeaters now ID with voice instead (or in supplement) to CW. True, there are more of these. However, you'll notice that getting the hardware together to do a voice ID is such a pain compared to a simple CW ID that those repeaters usually have stuff like digital playback/S-meters too (ie. they are well funded). Is CW a useful, cheap, and simple mode to use? I'd say yes, and people are voting with their repeaters on this one.

Your arguments for abolishing the CW requirement for VHF are compelling, however , given extra questions in other areas to replace it. The problem is, most of the anti-code proponents seem to just want to water down the tests. So it's much "safer" to try to resist change.

I have just acquired a set of "Voice Actuated Audionic FM Transceivers" manufactured for Realistic (Radio Shack). Currently they are on 49.845Mhz along with all the baby monitors in the world. I'd like to move them up some 250 Khz to the six meter phone band.

Can anybody direct me to articles which may have been published in some of the amateur radio magizines on moving such equipment up to six. Or maybe there has been some discussion on the net. In general, should the move require massive retuning? By that I mean, will I need to swap out coils or is it simply a matter of tweeking the existing coils?

I would also like to crank the power up a bit. The final output transistor, a 2SC380 is rated at 650mW. The spec on the power output as listed in the service manual is 80dB. I'm not sure what that means.(80dB relative to what?) The final output stage is a common emitter configuration inductively coupled to both the antenna and the driver/tripler stage. I assume that by simply increasing the current in the emitter by reducing the value of the emitter resistor I should be successful in my pursuit of higher power, as long as I don't exceed the maximum emitter or collector current ratings or power dissipation of the transistor. Am I on the right track? (Schematic below)

I would appreciate any help that I can get.

73,

Roger Jollis, KU6I
Fort Collins, Colorado

Actually, there is a satellite-based cellular phone service being developed by JPL and NASA called MSAT-X. It is not yet operational (in a commercial sense), but hopes are that it someday will be.

**** UoSAT-OSCAR-11 BULLETIN - 211   26 March 1990   ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** UoSAT-OSCAR-14 ** (de G3YJO)

The gravity boom on UoSAT-3 was deployed successfully under on-board computer

(OBC) control on Thursday morning (220390), following attitude control manoeuvres to 'lock' the spacecraft to the Earth's magnetic field. The attitude manoeuvres have been complicated by offsets experienced in the on-board magnetometer (which is used for attitude determination), requiring additional software filters to be included into the attitude control algorithms running on the OBC.

Following deployment of the boom and its 3.5 kg tip-mass to about 6 metres from the top of the spacecraft, delibration algorithms have been activated on the OBC to point the spacecraft towards Earth.

** UoSAT-OSCAR-15 ** (G3YJO)

The team at Stanford, having succeeded in detecting local oscillator (LO) leakage from the UO-15 command receiver, are now listening when the satellite is in eclipse - to determine whether the on-board NiCd battery is functioning.

** DOVE-OSCAR-17 ** (ASR)

Following the CPU crash on-board DO-17 which left the 2m transmitter ON, command stations were unable to access the satellite receiver due to blocking.

On 170390, the AMSAT Engineering Team successfully reset the CPU on DO-17 and commanded the 2M transmitter off. Dave Blaschke (W5UN), the owner of the world's largest privately owned 2 meter antenna, worked with Harold Price (NK6K) to overcome the desense problem (DO-17's command receiver is also in the 2M band). Even with 32.5 dBi gain, and nearly 2 megawatts of EIRP, it took several days of transmitting the reset sequence before they were successful.

Alberto Zagni (I2KBD) reported that the transmitter power was dropping significantly at the end of the eclipse portion of the orbit which indicated that the batteries were flattening out. Bob McGwier (N4HY) then strategized with W5UN as to the two best times to reset the spacecraft CPU and turn the transmitter off. The first was at the end of the eclipse period, when transmitter power would be at its lowest point. However, if it turned out that the battery voltage was too low to maintain the GASFET preamp in the receiver, then the next time to try was just as the transmitter power was falling off (soon after it left the sun and started the voltage descent in eclipse). The latter was the time which turned out to be successful.

The AMSAT Team is reviewing the events of the last week to determine the failure mode. Once they have completed their investigation, they will upload the operating system for DO-17 and continue commissioning. DO-17 is not expected to be fully commissioned until sometime in April.

I discovered earlier this week that the Cleveland area's only remaining Heathkit store is no more. Is Heathkit gone? If not, where and to whom do I write to get a catalog?

I plan to build a few simple kits to recover/(re-)develop my abilities, then dive into some more serious equipment-building.

In article <49812f16.1423f@godzilla.UUCP> dalyb@godzilla.UUCP (Brian Daly) writes:
>The ideal spacing is one wavelength to maximize the gain.

This is not true. The maximum_forward_gain_spacing is a function of the gain of the antennas being stacked. It could also be (almost equivalently) considered to be a function of the boomlength of the antennas being stacked.

There are also other considerations. Do you want maximum forward gain? Do you want maximum front-to-back ratio? Do you want maximum front-to-side ratio? Do you want some combination of these merit figures, like almost maximum gain with a clean pattern?

>What you are hearing is "commercial packet" It is in MMP protocol. Even if you could capture the bits with your TNC you would spend the next three lifetimes decoding the packet. Security is top on the list when it comes to public safety. MMP is a proprietary Mobile Data International protocol.
>

I hate to burst your bubble, but I know of a fellow radio hacker who has been successfully copying mobile data terminal traffic in this and several other so called "secure" proprietary protocols. He uses modified commercial trunking capable radios with their built in FSK demods to receive the bits and a combination of a stand alone micro and an IBM PC clone to interpret the messages contained therin.

He says most of the bits are used for various forward error correction and parity schemes. Encryption seems mostly to mean using proprietary alphabets (substitution cipher), overlaying the message with a LFSR sequence (scrambling, such as used on many modems), and XORing the underlying message or sometimes the encoded data after adding the FEC bits with a fixed multibyte pattern that is changed from time to time. (For example he says IBM field service transmissions to their portable terminals seem to use a 4 byte sequence changed every day and different for each terminal)

I do not believe that aside from Motorola's line of DES based DVP products (which really do use DES in a quite strong mode) most two way radio security is very secure. I personally think it pretty inexcusable for the manufacturers of these devices not to use DES or some moral equivalent - merely deciding that the protocol is complicated and nobody out there is bright enough to figure it out is pretty stupid in my opinion....

Of course the fellow who broke these mobile data systems was trained by the military as a cryptanalyst twenty years ago, so perhaps that isn't completely fair. But there are people who do this sort of protocol software work for a living who wouldn't find it hard either.

I have a number of control programs archived on my packet BBS at home which are written in C (good for UNIX portability which is what several people were looking for). Next time I'm there I'll see if I can make the source code available. I believe that I have one for Kenwood, Yaesu, and Icom (written by Phil Karn, KA9Q) radios.

> been
> the FM repeater club whose members call in highway accidents and provide
> communications for the local March of Dimes Walkathon. In that twenty
> years, our technology has remained essentially unchanged. (Yes, we now

So have our traffic handling techniques vis-a-vis "real" emergencies. One must apply the lessons learned during the walkathon to network operation for nuke plant drills or actual disaster situations. Otherwise, the walkathon is not "training for public service"; it's a waste of time.

> other) from their cars. In my area (NNJ/NYC) I can say that cell phone
> antennas outnumber every other kind of mobile two-way antenna by a

True in most metro areas, I'd bet.

> field) must become its single most important role. But if this is to have a
> ghost of a chance of happening, amateur radio is going to have to make
> some MAJOR changes. The no-code license is but the first step.

Including the attitude of many hams that "I'm the communications expert. Leave me alone and don't try to teach me anything" when public safety organizations like Red Cross, OEP, the police or whomever want to offer training to the local hams for disaster communications. The big selling point for ham radio over cellular or other two-way radio ops is that there is a large pool of people who own radios and have a tradition of being available as unpaid (the rules say we can't be paid anyway), TRAINABLE bodies that can replace or supplement an overloaded communications network in a disaster.

That selling point won't wash with organizations that have already had bad experiences with ham groups insisting on handling traffic their own way and trying to make command decisions without the training or authority to understand what is going on.

I was the Disaster Communications Chairman for the Monroe County Chapter of the Red Cross in Rochester, NY. Believe me when I tell you, ARES/RACES was the most difficult local volunteer group to deal with when it came to trying to get them to comply with Red Cross needs and procedures. This in spite of the fact that the person trying to train them was a licensed ham.

As one example, I was responisble for communications (for Red Cross) from the command post at a chemical plant fire in Brockport, NY a couple of years back. The NCS at the RARA club station, which is located near the OEP office downtown, pulled his radio operators out when _he_ felt the operation was over. Red Cross still needed radio operators for the recovery phase. The RACES Radio Officer decided that _he_ was in charge of the radio operators and would deploy and release them as he saw fit. This is typical of that organization in my area.

ARRL Letter - March 16, 1990 - Volume 9, Number 5 - Page 1 of 3

ARRL COMMENTS IN NTIA SPECTRUM MANAGEMENT INQUIRY

The National Telecommunications and Information Administration (NTIA) which shares responsibility with the FCC for management of the radio spectrum, recently began a comprehensive policy review of the use and management of the radio frequency spectrum in the US. The NTIA Notice of Inquiry (NOI) was published in the Federal Register on December 8, 1989. The NOI invited comments from the public on a wide-ranging series of questions. (See ARRL Letter Volume 8, Number 25.)

On February 23, 1990 ARRL Counsel Chris Imlay, N3AKD filed comments on behalf of the League. In its opening comments ARRL said "The League has been a participant in the spectrum management process for its entire 76 years of existence -- virtually the entire history of radio regulation. From that time until the present, the history of radiocommunication [contains many] examples of concepts being developed and implemented by radio amateurs that subsequently were adopted by the commercial sector.

"While improvements in spectrum management policies are needed... the public interest cannot be measured solely in the economic terms of marketplace forces. Just as public policy requires that there be public parks and other open space for the nourishment of the human spirit, so must there be `open spaces' in the radio spectrum where the public can pursue personal, noncommercial ends. This is the essence of the Amateur Radio Service.

"The value of the Amateur Radio Service is recognized internationally... virtually every country in the world makes provisions for the licensing of radio amateurs... A close correlation has been noted between the extent to which a government encourages Amateur Radio, and the level of technical development achieved in that country.

"On behalf of present and future licensees in the Amateur Radio Service, the League respectfully urges that considerable weight be given to the protection of this access in the present proceeding."

The League commented on certain of the questions posed in NTIA's Notice of Inquiry including:

- Encouragement of spectrum-efficient technology:

"The greatest impediment to the introduction of new technology...is the lack of an incentive for more spectrum- efficient techniques to be implemented within each existing service... the opportunity to seek new allocations simply relieves services of the obligation to use their existing allocations to full efficiency. If a service, or those who regulate the service, cannot efficiently use a block, it is puzzling why they should be permitted to expand into other services' blocks.

"A case in point is the land mobile service's apparent inability to find a way of incorporating `narrowband technologies' into their existing extensive allocations instead of seeking reallocation of 220-222 MHz from the amateur service to land mobile. It would seem logical that if narrowband technologies were more efficient than existing FM communications in the land mobile bands, then these technologies could displace FM and make room for additional assignments within existing land mobile bands."

- Alternatives to apportioning and valuing spectrum:

"Any discussion of alternatives to the present system of apportioning and valuing spectrum should not overlook a primary Congressional objective: the promotion of safety of life and property through the use of wire and radio communications (Section 1, The Communications Act of 1934). The Amateur Radio Service exists as a non-commercial, volunteer-based system that provides critical life-and property-saving communication services at no cost to the public, private or government sectors.

"Congressional support for the Amateur Radio Service was expressed in Public Law 100-594... this law states the sense of Congress that `it strongly encourages and supports the Amateur Radio Service and its emergency communications efforts; and Government agencies shall take into account the valuable contributions made by amateur radio operators when considering actions affecting the Amateur Radio Service.'

... (Continued next page)

"In countless well-documented cases, Amateur Radio operators have stepped in to provide continuity of communications for government and non-government relief agents, as well as to the public, in disasters when normal communications links have been disrupted or completely severed. In such cases, the value of Amateur Radio is enormous relative to the amount of its allocated spectrum.

"The Amateur Radio Service, through participation by thousands of dedicated volunteers, provides a resource that could never be matched by commercial services. The very nature of the service requires that Amateur Radio operators be prohibited from accepting compensation for their communications services; however, this means they cannot afford to compete, head-to-head, with commercial interests that seek spectrum in order to provide services for monetary gain. A pure marketplace approach to spectrum management would work to the serious detriment of radio amateurs, and thus to the public interest.

"Thus, any alternatives to apportioning and valuing spectrum must take into consideration the following mandates:

1. Uses of radio that promote the safety of life and protection of property are entitled to special consideration.

2. Networks built and operated by volunteers that provide necessary services should be valued according to what it would cost to duplicate the services.

3. The value to the public of any particular communications service is not necessarily commensurate with the financial resources at its disposal; it is not in the public interest to apportion spectrum based solely or even largely on ability to pay.

4. The public is entitled to access to its own spectrum."

The League also commented on these issues:

- FCC allocation and assignment processes
- FCC reliance on private user groups for specific spectrum management functions
- Domestic coordination
- Strengths and weaknesses of existing domestic coordination process
- US preparation for ITU conferences
- The strengths and weaknesses of the block allocation system
- Possible amendment of definitions of radio services
- Increasing use of spectrum by non-licensed (Part 15) devices
- Revenue enhancement proposals
- Measuring spectrum use; private monitoring

ARRL concluded by saying, "As citizens who stand to be significantly affected by the policies adopted as a result of this proceeding, both as consumers of telecommunications services and as volunteer suppliers of such services, radio amateurs urge that those spectrum management practices which result in an artificial scarcity of spectrum be revised or replaced.

"However, in implementing new practices that encourage greater efficiency in the use of the radio spectrum, it must be recognized that they will have limited applicability to the Amateur Radio Service. Attempts to force-fit the Amateur Radio Service into a new system designed to encourage innovative uses of the spectrum will lead to the opposite result in one of the most innovative radio services now in existence."

FCC FORMS WARC-92 ADVISORY COMMITTEE

FCC Commissioner Sherrie Marshall and Francis Urbany, Director of International and Agency Relations, BellSouth Corporation have been appointed co-Chairpersons of the FCC's Advisory Committee for the World Administrative Radio Conference (WARC-92).

The Advisory Committee will counsel the Commission on the preparations for WARC-92 and will develop and make recommendations for the US proposals and positions on topics to be addressed at the conference.

ARRL Executive Vice President David Sumner, K1ZZ, has been named to serve as one of the 35 members of the FCC WARC Advisory Committee. Committee members were selected to represent a diversity of telecommunications interests and were drawn from both the business and the academic communities

FCC ISSUED CALL SIGN UPDATE

The following is a list of most recently issued FCC call signs (March 1).

DIST	GRP"A" Extra	GRP"B" Advanced	GRP"C" Tech/Gen	GRP"D" Novice
0	WZ0Y	KF0IM	N0LPK	KB0GAM
1	WD1N	KC1TX	N1HJS	KA1VFZ
2	WW2Q	KE2SE	N2KJU	KB2JOW
3	NY3R	KD3RF	N3HWQ	KA3VVM
4	AB4TW	KN4EZ	N4YHA	KC4OVY
5	AA5QS	KI5DF	N5QBM	KB5LUZ
6	AA6UH	KK6HJ	N6YBR	KC6JCV
7	AA7DO	KG7AX	N7OIZ	KB7JVU
8	WZ8W	KF8ES	N8LXN	KB8JFB
9	WO9Z	KE9VF	N9JIN	KB9EDT
Guam	KH2M	AH2CF	KH2EI	WH2AMK
Hawaii	***	AH6KH	NH6WB	WH6CGU
Alaska	***	AL7LX	NL7TN	WL7BXE
USVI	NP2F	KP2BT	NP2DP	WP2AHA
P.R.	***	KP4QN	WP4XK	WP4IUH

*** indicates that all 2 x 1 call signs have been assigned in those areas.

The N-prefixed Group C (1X3) call# signs blocks for the fourth and sixth call districts have nearly all been assigned. After N4ZZZ and N6ZZZ have been issued, FCC will begin assigning calls from the Group D (2X3) call sign block.

OTHER FCC NEWS

Ervin S. Duggan was sworn in on February 28 as an FCC Commissioner by FCC Chairman Alfred C. Sikes. Commissioner Duggan succeeds former Commissioner Patricia Diaz Dennis. This brings the FCC to its full complement of 5 Commissioners.

An FCC Notice of Proposed Rule Making in PR Docket 90-100, released on March 7, proposes to relocate the Novice and Technician segment of the 80 meter band from 3700-3750 kHz to 3675-3725 kHz. The Commission believes that this relocation will reduce interference to and from Canadian amateurs. FCC is asking for comments with respect to the level of interference in the current Novice and Technician segment and how the proposed frequency move would impact current amateur operations. Amateurs may file comments on or before June 15, 1990, and reply comments on or before July 13, 1990.

Responding to an ARRL proposal (RM-6512), FCC has relocated automatic beacon operation in the 2 meter and 70 cm amateur bands (PR Docket 89-65). On 2 meters the band segment has changed from 144.05-144.06 MHz to 144.275-144.300 MHz and on 70 cm from 432.07-432.08 MHz to 432.300-432.400 MHz. ARRL also requested relocation of the 220 MHz beacon subband from 220.05-220.06 MHz to 220.275-220.300 MHz. FCC denied this portion of the request. Effective date of the change is May 18.

"NORTH POLE 90" EXPEDITION UNDERWAY

A joint UK/USSR expedition is underway with the two British members of the team attempting to reach the north pole on foot. The expedition "ice team" consists of Dr. Mike Stroud and Sir Randulph Fiennes. Their progress will be monitored from 2 base camps, one located towards the end of the expedition on the moving Arctic Ocean ice at approximately 86 degrees North Latitude and the other on Sredniy Island at the tip of the Soviet Union.

Two special event calls will be used. GB4MSS at Sredniy base camp and GB4ICE at the forward base camp on the ice. The main base station GB4MSS will be active during March with GB4ICE signing on in April. Both stations will be active on most HF frequencies. GB4MSS will also be active on OSCAR 10, OSCAR 13, RS10 and RS11. In addition, GB4MSS will upload weather and other information on the expedition to the Digital Communications experiment (DCE) on board UoSAT 2 (OSCAR 11). This information will then be made available on packet bulletin boards, worldwide.

Special QSL cards are available from the expedition's QSL manager Ian Crockford, GM1AUZ.

I believe there is still a Heathkit store near the Westminster Mall in Westminster (metro Denver), Colorado - but most people wouldn't be interested in that. I got a catalog about 6 months ago from Heathkit; heres the address & phone number...

Heath Company
P.O. Box 1288
Benton Harbor, MI 49022

Orders: 1-800/253-0570, 24 hours a day.
(the catalog has several other phone numbers)

Hope this helps... -Robert

Congratulations, Brandon!

For those of you who don't know him, Brandon is one of the hardest workers on Usenet. He moderates comp.sources.misc, generally keeping the group's quality high and the content useful (even though he DID accept a submission from me! :-), and contributes thoughtful, cogent articles on a wide variety of other subjects. He's one of the most respected people on the net.

He took the time to learn code and get his ham ticket. That says good things about ham radio - someone who's that busy making the time to fulfill the requirements for a ham ticket says that he thinks he'd get something out of it, and wants it bad enough to do what's needed.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

Line 2

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
10-11	International Designator (Last two digits of launch year)
12-14	International Designator (Launch number of the year)
15-17	International Designator (Piece of launch)
19-20	Epoch Year (Last two digits of year)
21-32	Epoch (Julian Day and fractional portion of the day)
34-43	First Time Derivative of the Mean Motion or Ballistic Coefficient (Depending on ephemeris type)
45-52	Second Time Derivative of Mean Motion (decimal point assumed; blank if N/A)
54-61	BSTAR drag term if GP4 general perturbation theory was used. Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63	Ephemeris type
65-68	Element number
69-69	Check Sum (Modulo 10) (Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)

Line 3

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
09-16	Inclination [Degrees]
18-25	Right Ascension of the Ascending Node [Degrees]
27-33	Eccentricity (decimal point assumed)
35-42	Argument of Perigee [Degrees]

```
 44-51     Mean Anomaly [Degrees]
 53-63     Mean Motion [Revs per day]
 64-68     Revolution number at epoch [Revs]
 69-69     Check Sum (Modulo 10)
```

All other columns are blank or fixed.

Example:

```
NOAA 6
1 11416U          86 50.28438588 0.00000140           67960-4 0  5293
2 11416  98.5105  69.3305 0012788  63.2828 296.9658 14.24899292346978
```

Note that the International Designator fields are usually blank, as issued in the NASA Prediction Bulletins.

I am considering having metal (steel) siding installed on my home and would be interested in hearing about any bad experiences anyone might have had with metal siding in a high RF environment (close to HF antennas). I am not worried so much about the effects of the siding on antenna impedance / radiation pattern, but more the possibility that corrosion could produce rectifying contacts which could generate harmonic energy.

Thanks in advance for any info.

I'm sure that you won't have to swap out the coils. If you only want to move them up .25 mhz, you probably won't even have to retune the coils. I'd imagine they are crystal-controlled, so all you'll probably have to do is order a new set of crystals from BOMAR (1-800-526-3935) for each unit, and you'll be off and running. The only problem I can forsee, is that they (BOMAR) will need the load capacitance across the xtal, and I don't know how you come up with that value. Perhaps the schematic will help. You'll also need the fundamental frequency of the crystal. They probably multiply it up to the 49 mHz range from some lower frequency. Again, the schematic should help. Calculating the rx xtal will be a little more difficult. You'll have to find out what freq. the IF is, and do a little mathematics. For example, if it is a 10.7 mHz IF, you'll subtract (or add, depending if you want high or low side injection) 10.7 from/to the desired operating frequency, then divide that result by whatever the multiplication factor is. If the existing xtals in the unit have their operating frequency listed on them, that will help a bunch.

[followups to news.groups. crossposted to s.e r.h-r for technical reasons, r.r.s because of satellite discussions]

The first week of voting was both productive and unproductive. We received 36 votes, and the ratio yes/no was 75%:25%. The bad news was that we had a disk problem and lost them all. The vote won't be extended, because those who voted in the first week have plenty of time to do it again (my appologies), and it may or may not be "legal" to do so anyway. Votes list (so far) below.

Lots also sent corrections for "satelite." Thanks. Really.

CHARTER: REC.ARTS.TV.CABLE

This group is for discussions pertaining in general to cable television, and satellite television. Broadcast only issues should go to rec.arts.tv. More specifically, discussions of technical, regulatory, programming, and/or customer service/cost/quality issues are welcome.

Technical discussions of cable programming technology are welcome, which is somewhat at odds to its placement in "rec," but this is proposed simply because of the infeasability of placing the group elsewhere. The original name rec.arts.tv.catv was objected to by several because of the confusion over the designation "catv" meaning community access TV instead of community antenna TV. Several have objected to placing the group in rec.arts, but there have been no alternative suggestions.

The newsgroups line would read:

```
rec.arts.tv.cable  Discussion about cable and satellite television
```

This newsgroup would not be moderated. It distribution would be world-wide.

To vote, send mail to:

```
uop.edu!quack!vote-no       for no votes
uop.edu!quack!vote-yes      for yes votes
```

A daemon will pick out the "From:" line and add it to a file. No reply will be sent. Second call with vote list will be posted Tuesday the 2nd, and third call with vote list will be posted Tuesday the 9th.

The vote will end April 16, 2359 UTC, with the usual 5 day wait for late mail.

Any personal mail may be sent to ...quack!mrapple, but votes sent there will not be counted. Posted votes will not be counted.

Vote list as of 4/2/90, 0000 UTC:

I am interested in installing cordless phone antennas or the right length of wire in all the rooms of my house, so that I would get good coverage from room to room, and wouldn't have to put a phone in each room.

Does anyone have any good suggestions about how to go about doing this? Like the best antenna length and how to connect them all up to the receiver?

Lance

Any and ALL help is appreciated

       ^^^--  49.845 + 0.250 = 50.095 MHz  (US phone band starts at 50.1 MHz)
```

AAAARRRGGH !!!!! You may well qualify for lid-of-the-year if you end up so low in the 6-meter band. All kidding aside, it is generally considered BAD PRACTICE to run even narrow FM below about 50.5 MHz; many would suggest a higher frequency. With so many people looking for band openings, which are fairly common these days, you would be MOST unpopular running FM (& ragchewing?) in the "DX window" at the bottom of the U.S. SSB portion of the phone band. There is a gentlemen's agreement to only work non-US/Canadian stations in the 50.100 - 50.125 MHz region, to make hearing the weak DX stations easier.

Good luck with your project.

73, Bob W3OTC

There was recent discussion about the need for non-conducting masts for vertically polarised antennas. IMHO this is not necessary. i have not done any serious research myself, just taken advice from the designers and installers of commercial VHF beams... (note i say *COMMERCIAL*, not *HAM* beams. The commercial guys dont get paid until the installation works.........)

```
   CONDUCTING  +
       MAST--> +                       Mast should pass through the 'electrical
               +                       center of gravity' of the beam,
      !     !  +  !   !    !    !      and extend out above the top.
      !     !  +  !   !    !    !      This maintains the symmetry of
      !     !  +  !   !    !    !      the conducting material intruding
      +=====+==+==+===+====+====+      into the electric field from the
      !     !  +  !   !    !    !      antenna, and helps to minimise the
      !     !  +  !   !    !    !      disruptive effect  that the mast may
      !     !  +  !   !    !    !      have on the polar diagram of the
               +                       antenna.
               +
               +
              /-\
              ! !

                               !    !    !    !    !    !
                               !    !    !    !    !    !
                               !    !    !    !    !    !
         <<Direction of fire<< +====+====+====+=+==+====+
                               !    !    !    ! +  !    !
                               !    !    !    ! +  !    !
                               !    !    !    ! +  !    !
                                                +
                   Mounting it like this        +
                   introduces an asymmetry      +
                   into the structure as far   /-\
                   as electrical balance is    ! !
                   concerned, and may distort
                   the polar diagram.
```

One other advantage of having the mast extending out the top is that if you have a 'very long yagi', you can use the mast extension to install guy wires to support the antenna boom. Non-conducting guys... now theres ANOTHER topic for discussion....(:-)

I've been experiencing several problems with my TH75 Dual-bander
HT ever since modifying the rig to work outside of it's
normal Amateur band limits. (Removed D-2 and W-1).
Every now and then the CPU will lock up during normal operation
and the radio will not allow transmit or change in any parameter
without first turning it off. Once I turn it on again - all
functions return to normal.
A less frequent, more severe problem is total reset of the CPU,
erasing all memory etc. - this also seems to happen out-of-the-blue.
Does anyone out there in Net-Land have any fixes for these problems
(besides buying Yeasu ...hi) or am I the only one who got the lemon.
I'd be happy to hear feedback.

By the way the HT allows TX from about 395-455 Mhz. Is there a way
I can bring up this window to the higher portion of UHF ?

Regards,
4X1DA
Richard Harel

Someone on one of these groups asked about a source for a shortwave radio
kit. I just received a catalog from "Yeary Communications" which appears to
be a source for parts for restoring old radios, radio books, and kits that
include SW radios. Now, these aren't digital-readout and fancy-capability
receivers; they are crystal sets, tube regenerative receivers, and simple
minimal solid-state models. Prices range from $9.95 to $99.95 for the kits.
They also sell some regular radios, scanners, and portable SW receivers.

Write for a catalog:

Yeary Communications
12922 Harbor Blvd., Suite 800
Garden Grove, CA 92640
[No phone given]

They also claim they'll "beat anyone's price" on radios, scanners, CBs, and some ham gear if you write for a quote. However, they don't seem to take chargecards (no mention of such on the order form) and their shipping charge seems quite high (12% of the order amount, $3 minimum) plus there is an extra $2 per-order "handling charge". They also sell used radio-related books and have separate flyers for those; if you are interested, ask to be sent the next issue when you write.

Regards, Will

As a newly-licensed Novice (still waiting for a call sign!), I thought a perspective from that point of view might be interesting. I should point out that I am not intimately familiar with all the issues surrounding this debate, so I'm sure I'll miss some points which might be obvious to the rest of you! :^)

I think most everyone would concede that the population of hams today is in decline. Reasons for this may not be so easily accepted though. It appears to me to be due to several factors. First, radio no longer holds the challenge and mystique it used to. Second, there seems to be little in the way of interesting discussion on the bands. One can only listen to so many rig and weather reports, after all. Finally, although it may not be difficult to learn code, many people undoubtedly find it no longer worth the effort and hence remain unlicensed.

I do not believe that code should be an entry-level requirement; it serves too much as a deterrent in this day and age. I would like to see it retained as an incentive of some sort for those who wish to learn it; perhaps by granting some additional frequency privileges to those who do so. To that end, I think we need a no-code license that grants a smattering of all operating modes and bands. This will allow a new ham to get his or her feet wet and see what else is happening outside their allocations. A VHF only no-code won't do that.

By judiciously allocating spectrum, I think the FCC could provide the incentive to upgrade. As a simple example, give the entry-level licensee some privs on 10 meters. They'll be happy until the band dies at the pit of the solar cycle, at which point upgrading will probably become very interesting to them. Of course, code would be a requirement for that upgrade but they don't HAVE TO upgrade. It's their choice.

I don't agree with the viewpoint that code should be eliminated entirely. There are still many occasions where it's useful. An advanced ham should know it, in my opinion.

As a final comment, let me say that I think the current testing system is a joke. Those who espouse simply adding more questions to the test are doing themselves and ham radio a disservice. These question pools are simplistic and require almost no knowledge of the underlying technical concepts to answer. I was amazed to find out that all the questions and answers are readily available! What kind of learning does this encourage? I strongly feel we need a testing process which ensures that licensees know something about what they're doing! We need to avoid the "appliance" syndrome.

Well, that's my perspective. Comments and/or flames are welcome! I have asbestos skin! :^)

>if he doesn't know how to respond to real-world questions like
>"You are given ten pounds of brocolli and asked to give equal portions to 25
>people, except for George, who isn't eating any. How much should you give to
>each person?"

Obviously, you give each broccoli-eater 3 cooked stalks (sprigs? whatever you call the individual pieces after you cut up the bunches...) and let the ones who want more come back for seconds. :-) [You said it was a "real-world question"; this is a real-world answer from a cook...]

Regarding the math/calculator issue, it is an interesting phenomenon. I grew up in the pre-calculator age, so learned traditional arithmetic in school. Yet now, though I am perfectly capable of adding in my head and doing computations on paper, I *don't trust myself* any more. I feel a compulsion to get out a calculator to do simple things like subtracting the check amount from the balance in my checkbook. To relate this to ham radio, I wonder if the same attitude arises once you get used to digital readouts? The old dial-scale interpolation skills might still be there, but you feel "better" or at least more comfortable with an explicit digital display telling you what you already knew.

Maybe it is due to the accumulated memory of errors made in the past from carelessness or sloppiness or whatever, but more and more you feel the need for the confirmation or reassurance those little glowing digits provide...

It seems like it has been for *years* that we have been reading the following statement, over and over, in the DX news:

FROM THE DXCC DESK. DO NOT SUBMIT QSL CARDS FOR WALVIS BAY BEFORE
JUNE 1. CARDS SUBMITTED BEFORE THAT DATE WILL BE RETURNED WITH NO
CREDIT. DXCC CREDIT FOR WALVIS BAY WILL BE GIVEN FOR CONTACTS ON OR
AFTER SEPTEMBER 1, 1977.

What IS all this anyway? If the contacts are legitimate, what makes them invalid or incorrect until the "magic date" of June 1? If the spot has been a "real" "DX country" since 1977, let the contesters or certificate hunters claim the damn thing. It certainly hasn't been worth using the prime position at the start of this DX news posting every issue to put this notice about "no, not yet...", especially when there doesn't seem to be any reason *not* to accept the silly cards whenever they are submitted in any case. Is this the result of some sort of political infighting or personality conflict? Somebody retiring as of June 1 or something?

I guess I just finally read this thing one time too many... Maybe it wouldn't have been so irritating if it had been a footnote or an addendum instead of the #1 item each issue....

The old curmudgeon,
Will

I tried to mail this, but the poster gives too-abbreviated a net address in his signature and the return-path failed. So this is directed to Jack Schmidling:

How about a posting (at least to the swl list) explaining just what the ARF is, and a bit of its history? I'm sure a lot of non-hams out here, like myself, have no idea what it is and why it exists.

Also, I note the dates you give are Thursdays, but the signature block indicates airings on both Tursdays and Saturdays. Is the Saturday one a tape repeat? Are the times unchanged after the start of Daylight Time?

I had thought that Litz wire was the stuff used for the cords of old-fashioned headphones, mostly because it was limp. Is this true? Is that difficult-to-solder stuff used for cheap earphones Litz wire?

BTW, I recently went looking for a crystal earphone for a project which needed a high-efficiency, high-impedance audio output. Surprise! Nobody makes those anymore. They're impossible to find. The guy at Halted didn't even know what I was talking about. I finally found one among the accessories for a 30-year-old Sony reel-to-reel tape recorder my dad has.

I guess that means kids won't be able to build simple crystal radios anymore :-(

Radio Shack had little earphones, but when I cracked one open, I found a little coil. Impedance was probably between 8 and 32 ohms. The leads seemed like what I have always called "Litz wire", i.e. tiny threads of copper woven with some kind of fiber.

The following item just appeared on the comp.protocols.tcp-ip newsgroup:

```
Article 11060 in comp.protocols.tcp-ip:
From: farber@linc.cis.upenn.edu (David Farber)
Subject: Re: High Schools on the Internet
Message-ID: <22608@netnews.upenn.edu>
Date: 1 Apr 90 14:16:53 GMT
Organization: University of Pennsylvania
```

We, at UPenn, are in the final stages of putting our
local magnet high school of engineering and
science -- the George Washington Carver High School
in Philadelphia onto the internet via
a spread spectrum radio link operating license free at
900 mh.

By the way, the GWC High School is an interesting case of
what can be done to turn the inner city
students onto science and education. They are really
an outstanding example.

Dave
David Farber; Prof. of CIS and EE, U of Penn, Philadelphia, PA 19104-6389 Tele:
215-898-9508(off); 215-274-8292 (home); FAX: 215-274-8192; Cellular: 302-740-
1198 "The fundamental principle of science, the definition almost, is this: the
sole test of the validity of any idea is experiment." -- R. P. Feynman

(end of included article)

At the risk of appearing to commit heresy and treason against amateur radio, I have to say that in my opinion this particular application represents a more worthwhile use of the 902-928 MHz band than yet another bunch of ham FM repeaters. And it is certainly far more worthwhile than letting the band go idle, which is its current state in most areas.

In my opinion, this operation ought to fall squarely within amateur radio's role in supporting education. I'd consider it a credit to the service if this operation were done under an amateur license.

The fact that so many hams see ham radio as an exclusive social club devoted primarily to the recreation of its aging members (and are determined to keep it that way) won't keep our bands from being used for other purposes. We can either enlarge the service to take in new and novel applications, or we can continue to wither as the FCC either reallocates spectrum outright to other services or increases the sharing in our bands, as with Part 15 spread spectrum on 902-928 MHz.

Phil

Me:interested only in public service?") I would say two things. First, the
Me:amount of public service traffic carried by CW is nil; the action is on

Jim Grubs: OOOOOHH. You're gonna piss of the BPL folks! ;-)

Tell me about it. A few years ago, I was invited to one of my Division Director's cabinet meetings. The question of whether packet stations should be eligible for BPL credit came up. It was very telling to hear people argue against it because it was somehow "cheating" to be able to handle traffic reliably and quickly without an operator, and that it was "unfair" to those who still handled traffic via CW.

By the way, several people have challenged my use of the word "nil". I didn't use it to mean "zero", but rather "too small to be significant".

Phil

I have'nt seen anyone announce the fact that a new ham exists. But it's true.

I first became active on this very networking system here in Sandy Eggo after a long hiatus due to this individuals efforts. He has been active here and on the various Pnets for mucho time. He has faithfully (F)orwarded msgs to me that he knew would be of interest. I just got a near new Yaesu FT-33R walkie-talkie due to diligence in monitoring the various newsgroups. I would have missed this super-deal had I not had this extra set of eyes.

This individual is so interested that he has contacted the ARRL to check on what his call group may be. He has found an outfit that will sell the complete FCC Amatuer License Datafile on CD-ROM with supporting software for $50.00. He is toying with adding with the idea of having this database online for the rest of us to us (maybe with bi-monthly updates). Now that some interest I'd say.

Well, Mr. Scott O'Connell (scotto@ipars) passed his Novice test two weeks ago. And then passed the Tech yesterday. I now encourage him to keep practising the code while it's still fresh. Something I failed to do and have always regreated. Scott is now joining our local club and of course is anxiously waiting for his Novice ticket. He tells me he wants to start yappin' on the radio. Another lid hits the frequencies; oh well...

Congratuations to Scotto and welcome aboard.

I agree heartily. And when they get their new ham tickets (either code or
no-code variety), they can tack on amps and boost their range. Hurrah for them!

Several years ago, there was a devastating tornado at Xenia, Ohio.
(Pronounced "ZEENya".) The Amateur Radio Emergency Corps (later AREService)
did fantastic work in the disaster. The work in that immediate locality was
done primarily on VHF FM repeaters.

Later, one of the radio clubs in Toledo brought some of the people involved
to Toledo to lecture us what they had learned about disaster
communications. During the Q&A period that followed one of them remarked
that at a similar Q&A session in another Ohio town he was asked by an old
timer, "Why did you use that two meter stuff? You could have done the job
just as well on 80 meters."

A little further probing revealed that the OT had never operated anything
but HF CW and literally was incapable of comprehending the need or interest
in anything else. I think much the same mentality is operating in the case
of much of the anti-packet and anti-no-code sentiment. They're not "bad"
people. They just don't comprehend what it is we're trying to do.

I have to agree with Phil (not only because I'm involved in the project :-).

Although in many parts of the country 2m is overcrowded with repeaters, simplex users, packet, etc., there is plenty of room on other bands, but nobody seems to want to take advantage of it. Part of the blame should be put on the manufacturers (e.g. Icom, Kenwood, Yaesu, etc.) for not making equipment for these bands, particularly 902. But even if they did, I'd guess that not many people would use them. Most people have already found their own niche in ham-dom and don't care to change, which is why 2m is still overpopulated while 220 is vacant in most areas, even though range on 220 is virtually identical to 2m and equipment is less expensive (many distributors/stores are selling 220 equipment at a discount because it isn't selling).

By the way, as Phil mentioned, the data link is not amateur-radio specific and does not require a license, even though it does operate within the amateur band - it's a shared allocation. However, if a lot of people (read businesses) see how useful the 902 band could be for both voice and digital communications, especially at power levels higher than 1 watt which is what the FCC limit is for this type of spread spectrum communications, chances are that we'll lose the band completely and it will all be given/sold to oranizations who WILL use it. But hey - we're not using it now, so what's the big deal...

--- Jeff

Congratulations to our very own netperson Bob McGwier, N4HY, on being named this year's winner of the Dayton Amateur Radio Association's Technical Achievement award. In part, the award recognizes Bob's inexhaustible work on the Microsat project.

This makes two years in a row that a Usenet denizen has won one of the three Dayton awards. Anyone care to try for Ham of the Year in 1991? :-)

Patty

I am looking for anyone who has had success in implementing a home-brew circuit for the Kenwood TM-x5x0 series of 144, 220, and 440 radios for the purpose of causing the radio to change frequency.

I am trying to design such a circuit that would use the DCL interconnection provided within this series of radios so that I could change the frequency of the radio remotely.

Is this possible? If someone out there has successfully accomplished this task I would really like to hear from them.

I will compile all responses and distribute as appropriate.

Thank you,
Steve Corso

Forgive my ignorance, but I have waited around waiting to see if this was brought up and no one else has asked, so I'll ask.

I've finished reading the proposal that was in QST April 1990 magazine about the FCC proposal for the Communicator license. There is one thing that is not clear from that. I've asked a few local hams, and they've kind of hemmed and hawed over the answer as well, so I think it's a valid question.

With the new proposal, HOW DOES A NOVICE UPGRADE? It says that Novices will be grandfathered in....and Techs too, but upgrading from Tech is not the issue. In order for a Novice to upgrade, must he upgrade DIRECTLY to General? Does he take the 13 wpm Morse code test and then the General written test? What happened to the Technician test? Is that no longer required? (Before the older hams say that this is the SAME test, let me remind you that the PREVIOUS General test was broken into two separate question pools so that NOW the General test and the Technician test are two separate entities.) Is the Novice required to take the Communicator test BEFORE the General test?

Here are the options (and my conclusions) of what might be done (and I don't advocate any of these, I'm simply asking which one it is!):

1. The Novice must take the Communicator test, then the General test and of course the 13 wpm Morse code test.
   Conclusion: The Novice must now memorize or remember not only the data for the previous Technician class, but also for the Novice class, which he has already passed. Plus, it is now a 60 question test, so he has to take 35 more questions than he would have had to take, were he to upgrade to Technician. A 60 question test may be overtiring for our younger hams.....

2. The Novice must only take the General test and the 13 wpm Morse code test.
   Conclusion: The Novice surely gets a break here, since the NEW material which was previously required for Technician is no longer required. Stuff like repeaters, packet radio, 2meter protocol, simple calculations on series or parallel resistance, capacitance and inductance may never be learned.....

3. The Novice must take the Technician test, as before, then must take the General test and the 13 wpm Morse code test.
   Conclusion: The Novice is basically provided the same means of upgrading as before. This does imply that the Technician test will be around as long as there are Novices in our midst, though....possibly a maintainability problem.

4. Other options? I can't think of any, but maybe I'm missing one.

Has anyone any idea what is meant by the current FCC proposal? I'd sure like to know.....since it looks like two of the Novices will be my kids (not yet, they passed the Morse code, but not the written yet!).

.
.
.
[Seeing how many potential Amateur Radio operators subscribe to this (rec.ham-radio) forum, I believe that we (the users of rec.ham-radio) should try and spend at least a little net-bandwidth talking about the enjoyable aspects of "ham" radio. It seems that (some of us) don't realize that this method of communications is very much like Amateur Radio in that this is an INTERNATIONAL forum. With this in mind, let me relate a recent enjoyable on-the-air experience and challenge others to do the same:]
.
.
.
I frequent the 10 meter band, and usually have my radio tuned to 28.330MHz when not using it for anything else.   One Saturday while working on a project in my 'shack' I heard a signal a little off this frequency and tuned the radio to get clearer reception. As I tuned the signal I heard a young voice.
As the voice became clear, I heard the person saying 'CQ CQ this is KA0xxx' (CQ means 'calling anybody'. Sorry I don't have my log in front of me, I can't remember the actual callsign). I answered the call, 'KA0xxx this is NM1D in New Hampshire'.

We chatted for 20 minutes or so. Her name was Theresa. She was about 16 years old and was at her grandfather's home. She goes there to use his shack because she does not have a shack of her own. She has a job now, and hopes to save enough money to purchase her own radio equipment.

As we chatted, we learned a little about one another. When she is not using 'ham' radio she enjoys walking. She frequently follows the train tracks with her friends, and enjoys the country side. I told her that I also enjoyed walking along the train tracks when I was a kid (I am 32 now), and my friends and I used to walk for long distances along the tracks.

I mentioned how the countryside here in New Hampshire is... many hills, and less than an hour from Boston, the White Mountains, and the Ocean. I told her that I also enjoy SCUBA diving here in New England in addition to my Amateur Radio activities.

This started a discussion about swimming and water in general. Being in the mid-west, she has never been to the ocean. Although her area has some lakes and ponds, the only 'large' body of water is the Missouri (sp?) river. She couldn't imagine swimming in the ocean because she imagined it must have a swift current like the river!!! I explained that the ocean does have some currents, but most beaches (in my area) are very 'swimmable', with a light to medium surf that makes the ocean a fun place to swim.

It was very enjoyable to 'travel' through her eyes to the midwest. I believe that she now has a better idea of how it is here in Southern New Hampshire. I am sorry to say that we had to end our conversation early (her dinner was ready), and I am looking forward to chatting with her again.

Amateur Radio IS very enjoyable, share it!!

Rich, NM1D

i'm disappointed to read in the the AMSAT Journal that the SAREX STS-35 mission will only have a 28.5 inclination - making direct communications to Seattle 47.7 latitude impossible...

is anybody out there going to be digipeating someway, somehow, so us poor out o' luck northerners will have a way to make contact with the packet set-up ???

Excuse my intrusion into this ham group but I think this is the best place to get my technical question answered.

RF input power; RF output power;

I was looking at a bunch of specs for (can I say this here) "CB" radios. The specs give numbers for RF input and RF output power.

So here's the question(s).

1) At what points are these values measured and by what mechanism?

2) On 3 different radios(transmitters) I see the following:
   a) RF Input- 5 Watts; RF Output 4 Watts
   b) RF Input- 5 Watts; RF Output 3.5 Watts
   c) RF Input- 5 Watts; RF Output 2.5 Watts

These radions are all advertised as being "5 Watts" but I assume that this isn't the "bottom" line as far as what you get as realized power

What's in the last stage ? Is RF output power rating related to type of antenna configuration (I assume that if I knew how these are measued I know the answer to that - but I don't.

Can someone clear thus up for me ?

Thanks,
Gary

>
>   AA6KX

As rebuttal, I need only offer an existence proof. I know a guy with self-described "code dyxlexia". Had a hell of a time hearing CW. He claims his VE "gave" him 5 wpm (!). Because of this, I can't tell you who it is. This same guy happens to have been a microwave wiz at HP back in the early 70's when hams were just getting their feet wet above 1 GHz. I often wonder what might have happened to our hobby had he gotten in 20 years ago.

When constructing a test as a means of filtering "undesirables", it is important to be testing the right thing. However, your point about the quick-to-whine is well-taken. It is my opinion that a CW requirement isn't what you want if you're trying to promote a technical hobby.

All this code-vs-nocode debate is putting the cart before the horse. We should first decide what ham radio is (should be), and then develop a testing method to achieve that goal.

In article <3336@optilink.UUCP>, elliott@optilink.UUCP I write:

> As the original question-asker (What's a good technical ham radio magazine
> these days, anyway?), I've received numerous replys. Here is my thumbnail
> summary:
> [Others omitted]
> 73: Low-tech, appliance operator oriented

As a reality check, I located a nearby newsstand that carries QST, QEX, Ham-Radio, and 73 magazines. I then invested this week's lunch money and bought them all (and the latest Scientific American, for the review of Currents_of_Death). After skimming them, I came to the conclusion that, at least for this month, 73 was the most interesting (even technically).

The articles ranged from analysis of the state-of-the-hobby, through discussons of fairly high-end technical operating practice, and even included some low-to-medium tech construction articles. Hardly the technical oasis I'm searching for, but better than the other offerings this month (Ham_Radio wasn't too horrible, either).

Still carrying my lantern...

Does anyone know of any currently transmitting satellite beacons in the range of 10-30 Mhz? These beacons are really fun to listen to on an HF general-coverage receiver because you can listen to the obvious "falling tone" doppler effects. The are also useful in ionospheric studies because they will bounce back into space if the MUF of the ionosphere is above their transmitting frequency. Sometimes one can actually listen to the spacecraft as it passes "holes" in the ionosphere, and often its signal will propagate hundreds of miles through normal HF propagation after entering through one of these holes.

Several months ago, I knew of two such satellites: UoSat-OSCAR 9, an amateur radio satellite, carried propagation beacons on most of the HF amateur bands, but it reentered last year. The Soviet Mir space station used to have a beacon on about 19.954 MHz, but I haven't heard it for quite some time. Perhaps it has a new frequency?

I would appreciate hearing from anyone who has successfully monitored any such satellites. If I get enough of a response, I will post a compiled list of them.

Thanks,

ANOTHER APPLICANT SEEKS FCC

APPROVAL FOR PCN EXPERIMENT

STATUS: Another entity in a growing list of wireless afficionados has filed an application with the FCC for an experimental license to provide personal communications network service (PCN).

PCN, a currently undefined and untested method of wireless communication, has caught the interest of numerous companies and individuals throughout the U.S., Europe and Japan.

The latest American attempt to experiment with PCN was filed by Matrix Personal Communications, Inc. Matrix proposes to provide a low-powered voice and data system for ten handsets in the Chicago area. In a second phase, the proposal calls for expansion to 100 handsets.

COMMENTS: The FCC is aware of the growing interest in wireless communications, as evidenced by the increasing numbers of PCN-related and CT2-related experimental applications.

FCC staffers are preparing a notice of inquiry, requesting additional information about wireless communications and the potential need for spectrum. Meanwhile, it's expected that the FCC will continue granting experimental licenses to applicants whose proposals are relatively small and are not likely to interfere with existing users. Larger proposals, like the recent Millicom filing, may be held in abeyance pending Commission action on the notice of inquiry.

THE NEW YORK TIMES, 3/27.

PHILIPS TO BUILD TV TUBE PLANT, p.D5.

"Detroit, March 26-The Philips Display Components Company said it would build a $100 million color-television picture-tube plant in Saline, Mich. The plant, which could eventually produce high-definition television picture tubes, is scheduled to begin operating in July 1992. Plans call for the production of a million 27-inch color-television picture tubes a year."

Re: Bob McGwier
I saw the advertisement you mentioned in QEX. I also explored an ad I saw in QST. Maybe you have seen the ad also with the earth WEFAX photo in grey-scale. I found out that this company buys the down converter from the company in QEX and sells at a lower price. I will be receiving my package shortly and will let you know. Has anyone received media wirephotos ?

SPEAK FOR YOUR DAMN SELVES!!! It just so happens that in Jeff's part of the country is probably THE most active group on 902- namely, the Mt. Airy Pack-Rats. I'll bet no one bothered to ask them- specifically WA3AXV, N3CX, WA3NUF, WC2K, WA3JUF, WB3JYO or the other officers of the club about their opinion regarding this subject. The impact of 1 Watt license-free equipment is already being felt on this band- the wireless stereo speakers that are now available immediately come to mind. There is a fairly large, but mostly unsung group of weak signal operators using the 33cm band all over the Northeastern U.S.- you don't hear much from us because we mostly are building stuff and running skeds, and because we're not all over the band. If the feeling is that we need to do something to save the band (and I don't disagree with that feeling), at least have the courtesy to save a small portion, say the bottom few hundred kiloHertz for those of us that pioneered the band. That way we can continue to experiment with useless modes such as CW and EME :^)- and- oh yeah, so we can demonstrate that we can reliably communicate over distances of hundreds of miles with low power and on a band where the expected range of communications is in the tens of miles.

There- I feel better now.

Flames to /dev/null- so there.

On April 7, 1990, at Worcester Polytechnic Institute in Worcester, Massachusetts, the WPI Wireless Association will be holding The Second Annual Open House in its Ham Shack. It will run from 10:00 AM to 4:00 PM. We will be working on many bands (160m - 10m, 2m, 440MHz, as propagation permits), and in many modes. The Club Station, W1YK, is excellently situated on the roof of Salisbury Laboratories, which is one of the buildings on the top of a large hill where WPI is located.

The WPI Wireless Association, founded in 1909, is the oldest college radio club in the United States. Originally 1YK, the station and club has enjoyed a wide variety of equipment and opportunites, including a 440 MHz repeater and a satellite tranciever station.

Come and help us celebrate our 81st Anniversary!

For more information, send mail to me (see signature), or any of the people you hear working as W1YK.

That's Quorum Communications, Inc.
P.O. Box 277
Grapevine, Tx   76051

Phone # (817) 488-4861

It's run by my good friend Rick Fogle, WA5TNY- tell him I said hello.

Rick has been working on this product line for a while now, and with the cooperation of several other noted VHF/UHF/SHF types (WB5LUA and Bill Olson W3HQT/1 of Down East Microwave), has developed what is probably the finest WEFAX line available.

If you're going to the Dayton Hamvention, Quorum will have a booth right next to (actually part of) the Down East Microwave booth. Stop by and talk to Rick, Bill, John WA3ETD (SHF Systems, makers of the single-board no-tune transverters), Rick KK7B, Jim WA8NLC, Al WB5LUA, and last and certainly least, me. I suspect Quorum will have hardware to demo and sell there.

Hope this helps.

COMMENTS ON ARRL FILE FORMAT FOR CONTEST LOGS

This is a response to K1CC's posting:

First, the philosophical objections. I am not a big gun and I have never spent the full contest period on the air. I typically work 300-600 stations in a contest. I have won the EMA section from time to time mainly due to weak competition.

All of my logs are kept by computer using software that I have written. I have no problem formatting a floppy in the format that you request. My question is why should I bother? It might take me a day to write the code and I would have to copy the files off my UNIX system onto an IBM PC to write the floppy. All for zero gain. And I don't even get the floppy back. Why should I go to that bother instead of just printing a log on my laser printer?

To attempt to answer my own question, there are several things that would motivate me to send in an electronic log and even pay for the chance to do it. First, if it were required for stations with over say 500 QSOs. This might cut down the competition. A more positive reason would be getting an audited log back. I would be happy to pay $10 to $20 to get back a floppy with my cross checked QSOs. A simple flagging of unique QSOs would be of value.

In short, I need some better reason than making a contribution to the ARRL's supply of floppy disks.

Now for the technical issues. First, you say, "aligned by column", what does that mean? I assume that you mean in fixed width columns padded (on the right or left?) with ASCII blanks and with a single blank between columns. How about a comma between columns?

Under "CALL" you say, "(allow 15 columns)". There is no specification for the number of columns for any other data item. Can I pad the others to 50 characters each? How about 512 each? Why should the call be longer than the largest station that I work? Should numbers be padded with zeros and right justified?

The statement "Complete exchange sent" and "Complete exchange rcvd" is not very specific. What about contest like SS where there are long exchanges? Should there be blanks in this column making it, in effect, multiple columns or do you want something like 123BWB2UMF65EMA as one hunk?

While there may be a few popular logging programs that many people will use, some of us will want to roll our own. You need to specify EXACTLY what the ARRL will and will not accept. I have been writing software for 30 years and the single largest cause of problems is lack of a clear statement of what is wanted. Do not assume that the world of amateur programmers out there will know what you mean.

Try the Soviet Radiosport satellites, RS-10/11. (Actually, one satellite with two transponders. I don't know which one is active right now.) Their beacons are on 29.403 and 29.453.

For those who've never tried this before, you can determine when they'll pass over your location by using tracking software in conjunction with the Keplerian elements that Tom Kelso posts to rec.ham-radio (and sci.space?) every week or so.

>Several months ago, I knew of two such satellites: UoSat-OSCAR 9,

Really? I thought it was only on VHF. If it was on HF, maybe its sister satellite, UO-11, is on HF as well.

Patty

Try (800) 253-0570. Visa, Mastercard, and American Express.

It sure looks like the beancounters have gotten to Heath. Half the stuff
in the catalog is only available assembled, and the retail stores (actually
a seperate corporation to dodge the state sales taxes) seem to be mutating into
Apple Computer dealerships. The local store is even closed Saturdays.

On the plus side, they're back in the hi-fi stereo kit buisness.

Now that Bull is buying the Zenith Computer division, who got Heath?
Bull or Zenith?

A very small operation, Wyman uses Wood and Douglas components and builds various units around them. I've used their gear for mobile robot video. Wyman sells FM TV gear, which has good noise immunity, although hams may find it difficult to find someone to talk to.

Video linearity and audio bandwidth are both poor by broadcast standards. But compared to typical AM ATV, it's great.

Heck, I wouldn't worry too much about 902-928 being turned over to commercial services anytime soon. Not so long as its primary occupant is the ISM service!

It's a garbage band, given to hams because hams won't interfere with rf heaters. :-) Now if the spread-spectrum data were able to get thru the crud, and there were little enough crud that the rf-modem vendors didn't get overwhelmed with complaints, then maybe...

Incidentally I just received the latest edition of Mischa Schwartz' book on modulation and noise. It has all sorts of useful information about modulation, coding, etc., albeit a bit too mathematical for my taste.

As quoted from <1223@necis.UUCP> by rbono@necis.UUCP (Rich Bono):

```
+---------------
|                  Amateur Radio IS very enjoyable, share it!!
+---------------
```

Undoubtedly. Unfortunately, I'm currently finding the *physical* requirements to be a bear....

To wit: I live in an apartment, on the ground floor. Putting up an antenna down here would seem inadviseable, the landlord doesn't like antennas hanging from e.g. the patio of the apartment above mine, and even if I'm allowed to put an antenna on the roof, I'm none too keen on climbing around up there. So I've scratched working from my apartment for now.

My next thought was, of course, mobile. Ever try to fit a radio---ham, CB, or otherwise, aside from in-dashboard models---into a Ford Escort? It doesn't look too promising, unless there's one that will fit into the dashboard. So far, the only radio I've been able to see up close is the Radio Shack HTX-100; it won't fit. About the only place I can see to put it is somewhere where it will be virtually begging for someone to break in and steal it---and I sometimes have to go to parts of town where having something that visible is a *very* bad idea. An alternative would be to stuff it in the glove compartment---my father did that back when he had a CB, and even had a special mount for it so that the radio could be seen and tuned within the glove compartment---but, again, it won't fit.

I seem to be stuck with a handheld. Do 10 meter HT's exist? (Until I upgrade, I'm rather limited in voice bands---and I don't want to try to operate CW while I'm driving....) I don't want to jump into 220 only to have it mostly disappear, and while 1270-1295 looks interesting, I'd like to also have a presense on bands which have a somewhat better chance of reaching non-local stations.

So I'm looking for suggestions. (Aside from "upgrade"---I'm working on it,
but I suspect that I'll be able to get on the air before a test date coincides
with my schedule.)

> sister satellite, UO-11, is on HF as well.
> Patty

UO-11 does not have an HF beacon. I heard several of the HF beacons on UO-9. It was a shame that more was not done with the beacons. I think the University of Surrey program is just outstanding, packing a lot of neat stuff into their birds on a shoestring budget. My only complaint with them is their `on orbit support' of a user community which could be a lot bigger if kept better informed. I could never find out what beacon was going to be on when and found it frustrating. This has gotten much better with UO-11 running DIARY and Jeff Ward's arrival at Surrey.

Anyone out in netland got any advice on HF transceivers? I primarily want one to drive transverters for six, four and two meters (yes we have 70.0 to 70.5MHz as a ham band here in the UK).

Requirements as follows:

'Old' HF bands (not interested in WARC bands).
Spin-tuned VFO (no nasty synthesizers unless they step in 1Hz steps!)
Analog readout to 1KHz or better.
AM/FM/SSB capability.
High resistance to crossmodulation (i.e a tube frontend!)
Room for lots of filters (15KHz, 6KHz, 2.4KHz and 600Hz).
Plenty of audio output (at least 4 watts to external speaker)
Input socket for ALC from transverter.
Able to run 100% duty cycle for at least 1/2 hour on FM/AM/RTTY duty.

User-serviceable without any need for special tools, non miniature components, no surface-mount devices, and finally;

No Gimmicks! I dont want scanning, memories, voice IDs, speech processors or any of that sort of stuff.

Somehow i think i have just described a member of the Drake '4' line.... alas these seem to be somewhat scarce on the European secondhand market. Some of the early TEN-TEC gear also seems a possibility (before ten-tec got bitten by the microprocessor bug!).

Work you on Six soon???

>>From: mark@gizzmo.UUCP (mark hilliard)
>Every day without fail there is a fellow on (ve31bb or v31bb)
>who has the loudest signal that I have EVER heard (he must be pumping 1kw)
>talking or trying to get people to talk about poor MFJ product quality and
>design. He is claiming all kinds of problems from MFJ on products and support.
>The number of people joining in is astounding! Is this possible? Is the
>MFJ product line as bad as he claims? If so, why is the league promoting

I have heard him and listened with upraised eyebrow on many, many
occasions. First off, I have heard him say that anyone who runs
under 250 watts is an "insect" whodeserves to be squashed by
the 1KW flyswatter. Me and my barefoot Uniden HR2510 (which has
worked from Indiana to Japan, Cuba, Mexico, etc.etc. take
exception to his "pro" ham attitude.

>I dont agree with his method of attracting attention to his cause on 10 meters.

Nor, it seems, does the Belize equivalent of the FCC. I heard him
whining one day that somebody at MFJ had gotten these folks on
him, who promptly told him to "cool it". He launched into a
diatribe about how Belize must have been worried about having
its foreign aid cut off and so on or maybe MFJ just bought
them off, so on and so on. He acted that day more like a
whipped puppy than his usual obnoxious self.

>Any comments on MFJ or this fellows means of getting support?

Yes. I think he acts like a real jerk. Sure, I'd love to have
a QSL card from Belize, but since his royal behindness deigns

to not lower himself to QSO with "insects", I can get nice QSL's
elsewhere, thank you.

I don't know about MFJ quality, not ever having owned any.
However, I *do* think that discussing the quality of ham
equipment on the ham bands is acceptable. I *don't* think
that V31BB'S diatribes against MFJ are acceptable. This goes
far beyond a simple discussion of quality and sounds more
like a personal vendetta. If I was running MFJ and had
to put up with this, I'd try to find a way to sue him
and force him to either "put up" evidence to back up
his slander or "shut up". (you know, "put up or shut up"?)

It is people like V31BB that give Amateur Radio a bad rap.

I agree, but since the $50,000 figure is pretty unbelievable, one might conclude that accepting this story as reported is "indicative of poor judgement as a ham". :-) Seriously though, knowing Jim Smith, I would be very surpised if this story is accurate.

To be charitable, many MFJ ham products seemed to be kind of junky,
but they did fill a need for low cost ham accessories that Heath
and other companies stubbornly refused to fill.

I had to fix at least one bad solder joint in 3 of the 4 MFJ
products I own. Some of the hand wiring was deplorable, including
insulation melted on the wires. IMHO, MFJ low power antenna tuners
looked kind of raunchy, too.

I generally like their electronic keyers. The MFJ products which use
PC boards appear better quality than their antenna switches and tuners.

Phil Howard's reply to a proposed method for learning CW included the
statement: "...I, and a very large number of hams are presently incapable

of learning CW...."

What on earth is this?? I see a KA9WGN on Phil's signature, so he has either learned CW (thereby completely disproving his point), or he somehow obtained his call without passing the code test. NO! There are no hams who have obtained their tickets under existing rules who are INCAPABLE of learning the code.

There are some good arguments for no-code, but the human mind's incapability to learn is not one of them, as any study of the psychology of learning will show. CW is nothing other than a set of symbols, much as writing, or the spoken word. If one is capable of learning a language, or to read, then one certainly CAPABLE of learning CW. I submit also, that if one can learn to type, one can learn CW. I hate to see the concept of learning MOTIVATION confused with learning ABILITY.

But onward to another point: Let's say that the CW requirement had been dropped in 1929. I submit that there would have been in the intervening years a number of attempts to reduce or eliminate the technical requirements for a license. I submit that MOST of the arguments that have been presented in opposition to the CW requirement could JUST AS EASILY be applied to any other entrance requirement, including examinations. Just plug in your favorite hang-up in place of "CW" in all the preceding arguments and see how it comes out.

Thanks,
Dube Todd, N5PDK

Extracted from "Broadcasting", Mar 19, 1990

Work toward a standard for the broadcast of high-definition television will get a big boost - if the FCC gets all that it asks for in its proposed $118 million budget for fiscal 1991.

....

According to a breakout of the budget request, the FCC has allocated $300,000 for outside studies on HDTV and $50,000 for new lab equipment for HDTV work by the (FCC) Office of Engineering and Technology (OET).

The balance of the additional (HDTV) funds would go toward the hiring of six full-time employees devoted to HDTV - one attorney and two engineers in the Mass Media Bureau and three engineers in OET.

....

The FCC's proposed budget for 1991 is $10.5 million more than it has to work with during the current fiscal year.

....

```
*   Further confirming Sikes's reputation as an enforcement-minded chairman, *
* 13 [new employees] would be involved in enforcement in one office or       *
* another: ..... , an attorney to effect its amateur radio compliance        *
* program, an attorney for rule-makings in land mobile and private radio,    *
* and two technicians and three engineers for the Field Operations           *
* Bureau (FOB).
```

The FOB's facilities would also give a facelift. Some $326,000 is slated for new equipment for the Bureau, $110,000 for new vehicles, and $100,000 for miscellaneous repairs to various field facilities.

Sikes told the congressmen that he would like the FOB to take a more active role in enforcing FCC rules. Right now, he said, the FOB, because of its limited resources, acts only after it receives a complaint.

....

Even though the request represents a 9.7% increase over fiscal 1990, Sikes made it clear that it falls short of what the agency needs to keep up with the dynamic telecommunications industry. Revenues from the "communications and information" sector doubled in the 1980's, he said. "At the same time, however, the FCC's budget actually shrunk by nearly one-third in terms of actual spending power," he said. "The FCC will...embark upon this last decade of the 20th Century with 20% less in revenue and human resources than it enjoyed in 1981."

....

```
         ---------------------------------------
         *   My emphasis  *

I read a posting a few weeks ago where a gentleman was interested in any mods for the IC-2SAT that extended transmit or receive frequency range. I didn't pay much attention to it then, but when the XYL got one for me as a birthday present... that attitude changed markedly! :-)

Well, I gathered up all I could find on the issue and broke out the soldering iron and took apart the radio that was less that one day old.
(OH NO Mr. Bill!!!!)

Here's the straight scoop and I HAVE tried this but you still proceed at your own risk (in case you were so foolish as to not know that :-)

Take the battery cover off the bottom and remove the two screws.
Remove two screws directly behind PTT button.
Remove one screw where handy-carry strap goes.

Gently pull on the front half of the radio and the radio will split apart but don't pull TOO far because the front half of the radio is still attached to the back half with that flexible plastic film wiring stuff. Fold front half to the right and lay it down.

WARNING: The battery//cover release button can now pop out and a little itsy-bitsy tiny spring can take off for parts unknown. (Ask me how I know this... I spent 2 HOURS looking for that little sucker!) Pull the button out of the case NOW and watch out for that blasted little spring!

All work is done on the circuit board inside the FRONT half of the radio (the part that you just pulled off).

EXTENDED RECEIVE:

Look along the RIGHT side of the circuit board and about halfway down the right side you will see a tiny circuit board that is mounted VERTICALLY on it, aligned from top to bottom. Look at the TOP of this little tiny board and you will see a normal diode (D-9) that is vertically mounted on the vertical board. Sounds confusing, but you can't miss it, it's right on the top end of the board.

Cut this diode. Don't try to unsolder it... CUT IT. Take my word on it.

WARNING: Don't pull the diode away from the board and leave it hanging. When you put the radio back together it is a very close fit and if you short the diode, the radio won't work. The PLL stays unlocked but no damage will occur. (yeah, I did that too :-)

If you stop right here and reassemble the radio, you will now have extended RECEIVE capability after you reset the radio according to the instructions in the manual on the first page. And it REALLY is extended. My PLL was still locked up down around 88 Mhz and actually received FM broadcast stations although it obviously sounded BAD! :-) The radio freq. read-out now will go all the way up past 1 GHz, but that's just the dial read-out, check the Channel Indicator and when it goes to a "U" for "Unlocked" you can keep an eye on PLL performance, however I was amazed at where the PLL was locking up and the fact that it was actually receiving (albeit poorly) across a very very wide range. Yes, of course the sensitivity is way down the further you wander from the 144-148 design frequency range but it still is pretty impressive, and the new freqs. can be stored in memory and scanned.

EXTENDED TRANSMIT:

Look for the big IC directly in the middle of the main board on the front cover (IC-1 40608). Go to the bottom right corner of it. Move your eyes slightly to the right and you will see three chip resisters in a row. Just to the right of THOSE you will see three silk screened dots that are bracketed by a rectangle of white ink lines where a factory diode package would have gone. The "dots" form a triangle with one at the top and two at the bottom. Install a diode (1N914 or equivalent) with the cathode on the TOP dot and the anode on the bottom left dot.

This will give you extended transmit from about 138-163 or so.

But if you believe that trying to get a diode in there (without shorting out a lot of stuff) is impossible, (and you are very close to being correct) then FORGET this approach. Instead get Icom's diode DA (# 1750000160) and install IT in the same place.

I tried using the 1N914, and it was a TOUGH job. It worked but looked horrible and was in imminent danger of falling off. I tried it out, verified that it worked... and pulled it right out. I have the diode DA pack on order now and will do it right when it gets here. I would politely suggest that you forget trying to use the 1N914 unless you have a micro-miniature repair facility at hand. (I did and still didn't like it).

To avoid hate mail .... I have to remind you that it is illegal to transmit on the air with this radio out of the Amateur Bands unless a legitimate emergency exists. (Type acceptance and all that.)

However if you (like me) plan on using it for a quick and dirty sig-gen into a dummy load, then it is the cat's meow!

In article <54050@bbn.COM> chartnes@vax.bbn.com (Clark Hartness) writes
a whole bunch of pollyanna-ish sweetness and light followed by
>   I think we should start another net. We can call it:
>   REC.HAM-RADIO.DEBATE
>   This way those of us who wish to read these debate team training
>articles can and the net can be freed up for technical questions and not
>opinions and critical analysis of every word in an opinion.

Sorry, Clark, we won't shut up and go away. If you're uncomfortable
with what you hear, the fault lies in yourself. No-code is a valid
subject for debate: we supporters believe passionately that we have the
very best interests of ham radio at heart. I don't think you do; I
think you just want to be left alone and not have your irrational
beliefs challenged because it makes you uncomfortable - no doubt
because you realize that your position is not supported by the evidence.

CW is dying, and the only regret I have about that is that those who
support it as a mandatory requirement aren't dying with it.

While pretty much trying to stay out of this worn out discussion, I really have to say that I agree with Dube Todd 100% on the point that he has made in his posting. There are some good arguments for no-code, but some of the ones read on here lately are pretty poor and Dube is right on line with his comments as far as I am concerned.

Paul, your comments about not being able to reliably operate modern HF rigs "reliably (if at all) without some knowledge of technical detail or regulations" is a joke. Many... I say again ... MANY MANY ... gosh darn it *MANY* CB operators are doing just the very thing that you are talking about AS WE SPEAK! You plug in the radio, you read a little bit of the manual... you hook up a mike and you turn it on! I am talking about amateur gear here Paul... there is nothing complicated about operating it now-a-days other than possibly keeping it on the right frequency, more on that line in a minute!

There are a LARGE degree of licensed amateur operators that also do this very same thing. They learn the regulations and the theory the way that Phil Howard says he learned CW. I.E. Just enough to get by and pass the test with absolutely no intention of trying to actually LEARN the stuff. After all they don't WANT to be "techies" they just want to TALK, and they see no need to spend hours and hours trying to understand what a Phase Locked Loop is or how it works. These people may perform tremendously in public service events but in some cases, putting a connector on a piece of coax is beyond them. I point as proof of that to the recent embarrassments we as ham operators suffered during the latest DX frenzy as well as personal experience.

Your comments are just not true Paul. This is not a flame at all, it is just an observation of the real world that says that about anybody that has the desire and the $$$ can make a HF rig work. And as you can see from my above paragraph, the same argument that some have been using to condemn CW applies just as well to all other portions of the test.

I like a no-code license... I don't like doing away with Novice and Tech. to get a "Communicator Class", but if that is what it takes... well ok. One of my worries is that before too much longer, the theory test will be the next thing to go for EXACTLY the reasons that Dube pointed out.

Let's drop the argument. Code can be useful. Code can be fun for those who like it. Big deal! That does not by itself make it necessary to require testing on code proficiency on VHF only licenses. Noone is going to change anyone else's mind on those points.

But NPRM 90-55 is up for consideration and comment. It seems almost 100% certain to be approved. Let us therefore limit our arguing to the more constructive issues of how best to implement no-code. Pax?

=========

MONDAY MARCH 26, 1990

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world on USENET and Amateur Packet Radio. It is available for UNLIMITED worldwide distribution.

* MUSES-A NEWS *

Hiten (MUSES-A) made the first lunar swingby at 05h04m09s JST (UT+9h) on 19th at the distance 14,073km, 27 minutes earlier Hiten separated a lunar orbiter and its rocket put it in lunar orbit. The orbiter was named HAGOROMO, which means "angel's robe" in Japanese.

[Source: The Yomiuri Shimbun, March 19 evening edition]

* DOVE NEWS *

N4HY reports that the crash of the DOVE computer which had caused the key-down condition has been brought under control. The DOVE transmitter was blocking the uplink command channel and the software crash was inhibiting the on/off cycling of the transmitter.

The solid key-down condition caused DOVE's batteries to discharge far enough that Dave, W5UN was able to send a special "hard reboot" reset command using his moonbounce (EME) antenna array in Texas.

Congratulations and thanks to W5UN and N4HY for their heroic rescue efforts.

[From: Tom, W3IWI via Amateur Packet Radio]

* AMATEUR RADIO ACTIVITY FROM MIR *

Soviet cosmonauts Anatoly Soloviev (U6MIR) and Alexander Balandin (U7MIR) began Amateur Radio operations from the MIR space station on March 9th, according to Leo, RA3AT.

Most activity is expected to occur on or near 145.500 MHz FM, with operations occuring after 18:00 UTC on weekdays and anytime on weekends.

QSL cards for this operation are available via UW3AX at P.O. Box 679, Moscow 107207, USSR (S.A.S.E. please).

* SHUTTLE NEWS *

KSC SHUTTLE STATUS REPORT - THURSDAY, MARCH 22, 1990 - 11:30 a.m.

STS-31 - DISCOVERY (OV-103) - LAUNCH PAD 39-B

This morning, workers successfully completed loading hypergolic propellants into Discovery's onboard storage tanks and the pad has been opened for normal work. Monomethylhydrazine and nitrogen tetroxide propellants were loaded into the orbital maneuvering system and reaction control system storage tanks. Hydrazine was loaded into the orbiter's auxiliary power unit storage tanks and the boosters' hydraulic power unit storage tanks.

Today, engine technicians will inspect a teflon coated seal at the joint between the engine 2 low pressure fuel turbo pump and the orbiter main propulsion system. A leak was detected at this joint during the helium signature test. This is a 12-inch diameter line at the engine to orbiter interface.

STS-35 - COLUMBIA (OV-102) - OPF BAY 1

Electrical connections between Astro and the orbiter are continuing and testing will follow. Connections of the Broad Band X-ray Telescope are underway today. An engine flight readiness test was conducted yesterday. During this routine test, engine start is simulated, valves are cycled and sensors and transducers are calibrated.

This week, checks of the water spray boilers, Ku-band antenna testing and leak checks of the elevon cove seal area are underway. Thermal protection system operations are continuing around the S-band antenna and landing gear doors.

> >--Phil Howard, KA9WGN--
> ><phil@ux1.cso.uiuc.edu>

BTW, the context of these quotes are a generalization of the people I
know who have expressed interest in ham radio and a disinterest in code.
It does NOT include those who express an interest in code.

> You sound just like many freshman engineering students complaining about
> having to learn calculus, or take freshman English. You don't yet have
> the broad educational background or the experience to understand what is
> good for you, and so you complain about things you don't understand and

> by their senior year that calculus is useful, and hopefully when they
> get out on the job in the real world and have to write [gasp!], they
> figure out that even freshman english might have been useful.

I happen to know that calculus and freshman English are not only useful but very critical. In fact, I would push for sophomore and junior level technical writing classes, and mandatory 2 years of linear algebra for engineering majors. Far too many engineering graduates cannot write a technical paper or even a decent resume. Far too many engineering graduates don't know applicable fields of math beyond calculus and differential equations. But I guess you probably agree with this anyway.

However, you have made one SERIOUS ERROR: you assume that code is good for everyone who is a ham. This is ABSOLUTELY FALSE!

Knowing code is good for anyone who wants to operate code.

> Note: this is not a personal flame; if you also hold these attitudes
> about CW please consider yourself flamed also.

And of course my flames are not personal either, but are to be spread to all those people who think everyone needs to learn an obsolete communcations mode they are not interested in (but I'm not against people learning it for whatever reasons they choose to).

I guess this whole issue is boiling down to:
    PRO CODE vs PRO CHOICE

PRO CODE people want to force their opinions and belief systems on others. PRO CHOICE people want to let individuals choose for themselves whether or not they will operate CW modes, and those who want to can learn it.

> I do not want to start a war. Unfortunately, I'm sure I just
> did. Please, only reply if you have rational logical comments (pro or
> con). Don't flame me or this newsgroup with no-content messages.

There is plenty of content here. Basically it is telling you about areas you misunderstand, like the fact that NO ANALOGY exists between something we agree about (freshman English and calculus are good for engineering students) and something that we do not agree about (knowing Morse Code is good for hams who don't want to use it).

How about reducing the subject to just the part that we disagree about: whether or not Morse Code is good for people who don't want to use it.

> >What is the purpose of a CW test? To cause people to be capable of using

I know I can learn CW, and actually I plan to after, and ONLY AFTER, the no code issue is overwith. I will remain a Tech until then.

> "can't" learn the code is self-imposed impediments. What this country

> needs is a few more ambitious people determined to conquer the
> (perceived) obstacles and be _WINNERS_!

Very few people can't learn code. But we are not talking about these people. The vast majority of people can learn code and I will say that just as you would. We don't disagree with that, so your arguments are wasting time. Let's argue about what we disagree on.

You got ONE thing right back at the beginning of your posting where you referred to people who "REFUSE" to learn code, as opposed to people who "CAN'T" learn code.

I passed the 5 WPM exam by memorizing the code table well enough to mentally look it up fast enough to get enough of the test transmission to be able to squeak through the test. My copy was only 30% but I managed to get enough of the right stuff to get 9 out of 10 questions right.

Now, did I "learn" code? Definitely not.

Do I plan to "learn" code sometime in the future? Well, I must admit that I plan to, but only because I happen to think that CW might really be a fun mode to operate. I was bored stiff with it at 5 WPM but I think it might be more fun at 30 WPM. Someday I will give that a try.

But not everyone shares my feelings nor yours.

But for all those people who do not share my curiosity and interest in code, I would not wish upon them the waste of time they have to go through to EITHER learn something they won't use, or memorize something they won't be able to use that way.

Sometime in the early seventies, STORNO was bought by General Electric.
So you may find that some GE repair shops may have STORNO Docs. GE sold
STORNO a few years ago when they decided they could make more money by
shuffling money (banking) than by making stuff.

STORNO is a Danish company. They made some excellent gear, including
the walkie-talkies used by the London Bobbies. STORNO used to be a
subsidiary of STOR NOrdisk Telegraf (Great Northern Telegraph GNT). Yup
the people that made those Morse code punched tape machines.

If you have trouble getting STORNO docs from a GE shop, you could
write to a Danish Ham that used to work for STORNO and may still have
contacts there:

In his posting about the current DXpedition to Bhutan, AA6KX claims that the Bhutan government is "extorting" $50,000.00 from VK9NS to get a license to operate there, and that his allegation is supported by the current issue of The DX Bulletin.

Both the current issue of The DX Bulletin and QRZ DX say that he was told to "bring $5,000" to enter the country, NOT "pay $50,000 for a license."

Please get your facts straight before broadcasting something like this to the world. Not only does the DX Bulletin plainly say 5,000, not 50,000, but neither publication says anything about "extortion" or this even being a fee to get a ham license!

Being the friend who likes it, I'll stand by the claim. The 1278 does generate some RFI -- unless you ground it, as per the directions. Aside from that, it's heads above the rest...as long as you have the current ROM and board revision (according to QST, the previous rev was pretty bad).

I wasn't too impressed by the software for the mac, especially since the
version for the PC is so much better. But, having other facilites, this
doesn't bother me. What would bother me would be to have hf packet
performance that's as bad as the other MMDCs, or not having grayscale on
my FAX.

Most digital devices require at least some modification for the shack
environment, even those destined for the ham market.

Obviously untrue. While you can operate an hf station without knowledge of
CW, you can't do so reliably (if at all) without some knowledege of technical
detail or regulations.

NEXT!

Hello All,

I am only a reader of this newsgroup for the most part. I have sent personal responses to some of the articles I have read, but the Increasing CW speed, no CW, next best thing to CB radio with technically minded people articles are quite frankly 90% of what I see now.

I dont believe that the net was intended for the purpose of training debate teams but it is quickly heading that way.

In the future I believe that there will be a no code class if for no other reason than the fact that human nature makes us use our minds to figure a short cut method to attain our desired results. Someone will get it pushed through one way or the other.

I learned the code. I can still use it. I seldom use it. I dont think it is a barrier that cannot be overcome by even the dumbest of us idiots (Paul Flaherty's name for whom ever lights his flame). I do believe that some dont want to be bothered by something so trivial as code and these are the ones who will push it into a no code class sooner or later.

I think we should start another net. We can call it:

REC.HAM-RADIO.DEBATE

This way those of us who wish to read these debate team training articles can and the net can be freed up for technical questions and not opinions and critical analysis of every word in an opinion.

Of course I am expressing my opinion which is not worth a hill of straight keys to the next guy, but as a future practice I'll just not read this type of article as I am sure Paul will inform me that I done have to if I dont like them. I'll just save all of you out there the time of writing the response.

Thanks for the time. Hope everyone has a nice day in the Ham Radio World.

I'm afraid HF packet is a dead issue with me. I'm not qualified to operate that mode. It doesn't seem to matter that I am responsible for all of the digital communications where I work, or that I am duly licensed to operate our HF tranmitters. The problem is that, because I have never been one bit interested in code, I'm obviously too stupid to understand HF packet.

But if I were to wind up in a prison camp and forced to brush up on my code through the heating pipes, I'm sure I could win the Nobel prize for all of the advances I made in digital communications theory while locked up.

Michael Stick in the Mud.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

```

I feel that I am not alone in expressing a general dissatisfaction in the way that the code and no code discussions are now headed. It seems that the way to win an issue now-a-days is to make the other person look as stupid as you can and to throw names back and forth at each other.

Even people that DARE to suggest that the discussion be toned down a little are "FLAMED". Various labels are generated on both sides and the issue has degraded into one of name calling. There has even been some innuendo that a PRO-CODE person is better off DEAD.

ISN'T THIS JUST A LITTLE BIT TOO MUCH?

It is my honest opinion (IMHO) that there are certain elements that are using this forum not to argue their points on the no/pro-code issue, but to show everyone how good they are at making other people look stupid. There is no effort in trying to understand the real meaning behind someone else's points, rather there is an effort to take advantage of any little slip or mistake in what a person says in public in order to baste him (or her) over the charcoal pit of public humiliation.

Keep one thing in mind. No one that I have ever known LIKES to be made to look stupid in public. I for one ALWAYS sympathize with the person that is getting the tar beat out of him by some slick tongued devil, and I

```
submit that the people that are doing this are causing more harm to their
cause than they can possibly imagine.

So the thought then comes to mind.... Are they really using this type of
behavior to PROMOTE their cause, or are they just trying to feel smug and
self-content in the knowledge that they are the KING of FLAME-THROWING?

Notice that I have been careful in trying not to point a finger at any one
faction.  Keep this thought in mind when my little posting here comes under
attack from one side or the other.  The person that attacks what I have
written here is the one that is guilty of what I have been saying.

Let's watch and see.

> This is off the original subject by far, but the above caught my eye.
> Does the average person these days *have* 2 photo IDs?

I usually use a driver's license and a US Passport when I need ID for something
I'm prepared for. But I would wager that *most* Americans don't have a Passport.
(They aren't very useful if you don't travel.)

> I'm guessing many non-drivers may not have *any* photo ID.

Every state I have lived in for the past 5 years or so has issued
state ID cards to non-drivers. They usually cost a couple of bucks.

> Does this requirement cause any problems? Anybody else out there have
> comments on the issue of photo-ID?
```

The VECs at my last test checked to see I had the conformation slip for my test time and my driver's license. That was all. The FCC checked my conformation slip and that I had my own pencils for my commercial test.
I could have had Nikoli Tesla take my test for me.

Michael

TO: rusty@cadnetix.COM (Rusty Carruth)

C6Anyway, I logged 2 German stations, and one Lithuanian on 10 meters
C6last saturday! My first European station!!!!

Congratulations!

C6(All this with about 100 watts into a 5/8 wave groundplane mounted
C6about 30 feet off the ground! ON SSB!)

I spent my first year on the air with a TenTec Argonaut and a ground mounted vertical. While I missed a lot, you don't need power all the time.

C6(Editors note: please excuse my excitement, but I never thought I'd
C6ever work "real dx" until I upgraded and had 'real power', or
C6switched to CW, or a 'real antenna', or .....)

You'de be suprised what moderate equipment can do. How about Easter Island on 2 watts and a dipole? Or Minneapolis on 100 milliwats and a 1/4 wave whip?

C6Which reminds me - I had an email message a while back which said that
C6I should not work HF SSB because it would ruin my upgrading. Not so!

C6Making contacts on HF only makes me fear the time when 10m becomes a
C6local-only band... No way do I want to be a Tech when the sunspots
C6change! This is too much fun!

Well, if you do it exclusively your code speed suffers from lack of practice but don't give it up. Sideband techniques take some practice too.

Enjoy!

> Phil Howard's reply to a proposed method for learning CW included the statement: "...I, and a very large number of hams are presently incapable of learning CW...."
>
> What on earth is this?? I see a KA9WGN on Phil's signature, so he has either learned CW (thereby completely disproving his point), or he somehow obtained his call without passing the code test. NO! There are no hams who have obtained their tickets under existing rules who are INCAPABLE of learning the code.

I see you did not read AND ABSORB the posting I replied to. I did NOT LEARN Morse Code, I memorized it enough to pass the exam. This kind of practice is what Ken was complaining about. I was only trying to show that it is in far more common practice than he realizes.

The incapability is based on the fact that the test is a 5 WPM test which does lend itself to LEARNING Morse Code, but only to MEMORIZING it. To really KNOW Morse Code, you will be able to copy in your head at speeds well above 20 WPM. The incapability is not IN ME, but rather IN THE SYSTEM. Sorry I did not make that clear.

You next commented that inability to learn should not be related to motivation. Since you missed the point in comparing the two postings, I won't count that useless argument against you.

> But onward to another point: Let's say that the CW requirement had been dropped in 1929. I submit that there would have been in the intervening years a number of attempts to reduce or eliminate the technical requirements for a license. I submit that MOST of the arguments that have been presented in opposition to the CW requirement could JUST AS EASILY be applied to any other entrance requirement, including examinations. Just plug in your favorite hang-up in place of "CW" in all the preceding arguments and see how it comes out.

If you submit that most of the arguments against a code test can be applied to the real requirements (which are NOT necessarily what are actually being tested today, BTW) then please post the specifics. I happen to believe there are none, and /dev/null is my basis of proof.

So, what if the CW test had been dropped in 1929? I suspect the military and the maritime services would probably have been LED by Amateur Radio into phasing out CW in favor of new technologies instead of the current case where THEY are leading US. CW would NOT have gone away, and I don't expect it to even if EVERY class of license becomes no code.

> band (mine is the Rolling Stones), and what is their favorite mode.

If ARRL only surveys its members, that tells you information ONLY about its membership. It certainly does NOT tell you much about the ham radio population as a whole. The ham population is a selected population in the first place, since it consist of the union of two sets: those who think the code test is wonderful, and those who, like me, said W.T.F. and went ahead and took the stupid test (many of whom passed it without learning anything useful). Further the ARRL membership, due to the alienation the ARRL has caused to some in the past, does not represent the ham population; and certainly one division does not.

One group of people who are left out altogether are those who could and would make significant and important contributions to amateur radio in all areas except increasing the number of DXCC-CW awards given out. They are not members of the league and are not even licensed due to their frustrations with those hams who would have them become interested in only a narrow range of the hobby.

> By the way, regarding favorite bands, 30% chose 2 meters, 24% chose
> 20 meters, 12% chose 80 meters, 11% chose 15 meters, 8% chose 40 meters,
> 5% chose 10 meters, and 3% each chose 220 and 450 MHz.

Gee, that's close to the proportion of LIDS on the bands.

Hmmm, now that's a GOOD IDEA!!!

Seriously, the field strength in your neighbors house follows the inverse square law for distance given a constant lobe-angle parameter, which is not constant as the antenna goes higher; it further reduces the field strength. Even hams want less of their power being dissipated in the various bizarre radio receivers their neighbors have by other names.

> I'd like to see a study done where they control for the kind of antennas

A simple field strength study might do fine in many cases as well. I know if I lived next door to a ham, I'd at least want out antennas at differing levels to avoid overloading each other.

Are you so certain? Without exception, every person I know who is in favor of a no code license is against the particular way that 90-55 proposes to do it. Fortunately the regulatory process does allow for changes to be introduced between the Notice of Proposed Rulemaking and the Final Notice of Rulemaking without having to start the process all over again. This is why comments rather than mere votes can be filed on the matter.

I have already come up with NINE alternatives to the 90-55 proposal, and plan to include them all in my comments. I also suspect that 90-55 will exceed even 87-14 in the total volume of comment filings.

>(They aren't very useful if you don't travel.)

I'd urge anyone with even the remotest chance of traveling out of the country to get a passport. Believe me, they're a *lot* easier to get when you're not in a hurry. They're not that expensive, they do come in handy as a very credible form of ID, and even when traveling to countries like Canada where they're not strictly required, they're nice to have.

Can anyone tell me what are some characteristic frequencies that the following operate on:
1.)Cellular phones
2.)Cordless phones
I have monitored High Seas Ship/Shore, but have nevered monitored other phone calls below 30 Mhz.

I plan to propose adoption of the Canadian Plan as is except for
modification of the homebrewing restrictions.

RTTY DX Notes, 1of3, 3/23/90

RTTY DX Notes for Weekending 23rd March 1990.
Part 1 of 3.
BID: $RTDX2303

It seems that this week will be the week for DXpeditions. They will be appearing from some very exotic places, so keep the fingers sharpened up and the screen alive at all times. Regarding the remarks last week about the JT0DX cards, it seems that some German stations have received theirs this week. While there is life there is hope. ZS8MI cards of course are another matter. They will be issued when the operator returns home to ZS6PT.

Our thanks this week go to I5FLN, JA1BLV, JG1NBD, KT7H, OD5NG, TG9VT, VE3JPC, VK2EG, W2JGR, W5KSI, and the Tri-State DX Association VHF packet cluster. Thank you all for the good DX reported.

SB ALL @ RTTYDX $RTDX2503
RTTY DX Notes, 3of3, 3/23/90

RTTY DX Notes for Weekending 23rd March 1990.
Part 3 of 3.
BID: $RTDX2503

AP2NK is Nasir Hkhan, Box 1944, Islamabad, 4400, Pakistan.
A51JS (yes, it is Jim Smith) will QSL via VK9NS.

Notes Of Interest:

Well, as you can see from the DX notes, Jim Smith has arrived in Bhutan and is active. He will be there for about three weeks, then he hopes to go to S2 (Bangaladesh). More later.

There is a report that A61 (United Arab Emirates) should be on this week, for about 2/3 day operation.

Abu Ail A15 also should be active this week, according to DJ6JC who will also have DJ6SI and DK2WV to help fighting the DX and helping with the keys. This is possibly the last operation of this callsign, as the light house is being taken over by the Yemen authorities at the end of the month.

Mayanmar (Burma). It is reported that a Hungarian group will operate from there from 22nd March for 14 days.

March 29 also sees AA6HT and KC6XDP operating from V29 until 9th April.

April 11th to 15th will see Aves Island on the air, only digital modes.

April 11th to 23rd will see Jarvis Island activated. Send donnations to P.O. Box 2368, Stanford , CA 94309-2368.

Off again, on again, Spratley is on again sometime in April. They will operate from Vietnam before and after the Spratley operation, we hope.

Western Sahara. There will be no RTTY operation during this trip, sorry to say. Maybe later.

GL DE DX1 (VK2SG).

I've been licensed 39 years this coming Friday. The original renewal
requirement then was you had to certify that you had operated x hours
(6 comes to mind) AND that you could still copy CW at the speed
required for granting your grade of license. In theory the FCC could
ask you to prove it. I never heard of anyone who was actually asked to
do so. As you said, the minimum on the air time did not have to be CW,
but of course the ARRL always thought it SHOULD be and so recommended.

Actually, this wouldn't be too bad. 200 mm == 20 cm =~ 1.3 GHz. This
would include everything higher in frequency than our current 23 cm
band. Certainly, we would have a lot more bandwidth than we now have!
I personally wouldn't miss the loss of the DC (HF) bands, but I would
miss 432 MHz. Of course, I'm sure we could learn to use 1.3 GHz for
coordination.

Yes, but the CB operators aren't doing so reliably. Ask a CB op about MUF. At least, most hams know enough to listen to WWV to catch the propagation bulletins, and to understand what they mean. Most hams also know what band to be on at about what time to work into a particular part of the world. Most hams build their own antennas, and know enough to look at the SWR meter now and then to make sure that the antenna system is radiating. Most hams know something about RFI and TVI, and how to get rid of it (now there's something our appliance ops don't know!).

Personally, I'd like to see the written exam changed to make the regs part tougher. But as it is, most hams again know the rules and follow them.

There's a big difference between the so - called appliance operators, and a decent HF operator (and an experimenter). Hams generally qualify as decent HF ops, since they do know at least a little about how the system works. Clearly, most hams are not experimenters, but to belittle them because they don't build their own hardware is unfair.

In article <9003231820.AA29999@ti.com> dube@cpdvax.csc.ti.com (DUBE TODD)

> I submit that MOST of the arguments that have been presented in opposition to the CW requirement could JUST AS EASILY be applied to any other entrance requirement, including examinations. Just plug in your favorite hang-up in place of "CW" in all the preceding arguments and see how it comes out.

In my opinion, the popularity of this argument shows that American amateur radio is in serious trouble.

The only way your argument has even a tiny bit of truth is if your view of amateur radio consists purely of appliance-style operation. But if the intent of a license exam is to see whether an applicant is capable of furthering the basis and purpose of the amateur service (as opposed to merely chewing the rag and collecting QSL cards), then there is a world of difference between the CW and technical requirements.

There are many ways you could further all of the reasons amateur radio exists without ever using (or knowing) the code. The same is definitely NOT true of the technical and regulatory knowledge one is required to have to become a ham.

In response to your likely rejoinder ("But wait! What about people who are interested only in public service?") I would say two things. First, the amount of public service traffic carried by CW is nil; the action is on the voice and packet nets. Second, although "public service" is a motherhood-and-apple-pie issue that moves many hams to heartfelt expressions of civic devotion (especially when battling tower ordinances or spectrum grabs), the cold, hard fact of the matter is that we're losing ground VERY rapidly to the competition, and I wouldn't bet the future of our service on it.

Our mainstay in the "public service" area for the past twenty years has been the FM repeater club whose members call in highway accidents and provide communications for the local March of Dimes Walkathon. In that twenty years, our technology has remained essentially unchanged. (Yes, we now have "pinball machine" computerized repeater controllers and synthesized HTs, but the basic "service model" of an FM repeater/autopatch is the same today as it was in 1970). But the outside world has changed: a lot of people without ham tickets are now just as capable as we are of calling the police (or each other) from their cars. In my area (NNJ/NYC) I can say that cell phone antennas outnumber every other kind of mobile two-way antenna by a *very* healthy margin. (One sign of this change: nobody asks me any more if my HT is a CB or if I'm a cop; they ask what kind of cell phone it is.)

I am not trying to attack amateur radio public service per se; it is certainly most worthwhile. It's entirely possible that our liberal allocations vis a vis the rest of the world are due in part to our tradition of public service, something unheard of in many other countries.

My point is that public service is by no means sufficient to justify our service considering our stagnant technology and the much wider variety of alternatives now available to the public. If amateur radio is to survive, it will have to place far more emphasis on the other reasons it exists. In particular, amateur radio as a unique training ground for young people interested in electronics and communications (and possibly a career in the field) must become its single most important role. But if this is to have a ghost of a chance of happening, amateur radio is going to have to make some MAJOR changes. The no-code license is but the first step.

Phil

Aurora can only be effectively utilized if CW is used.

During contests, I can do a CW contact in about 1/2 the time a voice contact takes, and I never have to ask for a repeat.

Once, about 10 years ago, I copied a distress call from someone who went down in an airplane, near Mansfield, OH. Since the signal was CW in a phone band, it stood out like a sore thumb and attracted my attention very quickly. I was able to help out these people by calling the local FAA and giving them the details. A signal in any other mode would not have attracted my attention (or anybody else's) like it did. (Note: it was a very weak signal, and I doubt that it would have been copyable if it wasn't CW.

The CW mode is very useful. I could go on, but I don't think you want
me to.

WO-18 TAKES EARTH PICTURES

HR AMSAT NEWS SERVICE BULLETIN 055.01 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 24, 1990
TO ALL RADIO AMATEURS BT

WEBERSAT-OSCAR-18 Successfully Takes Pictures Of Earth With Its CCD Camera

Chris Williams (WA3PSD) reports from the Weber State University (WSU) Ground Command Station in Ogden, UT that WO-18 took several excellent pictures from outer space this week with its onboard Charged Coupled Device (CCD) camera experiment. One picture of particular interest was of the Indian Ocean which, after color recovery by WEBERWARE 1.0 software, showed plenty of blue ocean and lots of clouds. Since it has been determined that the CCD camera is working well along with the rest of WO-18's satellite subsystems, officials at WSU's Center for Aerospace Studies (CAST) have declared WO-18 to be a major success. Two weeks ago, however, it was not definite weather the CCD was working properly since the first few pictures were either totally dark or completely white. After investigation, it was theorized that the camera lens was either pointing off to deep space or straight at the sun! Once the schedule for taking pictures was randomnized a bit, WO-18 finally was pointed at the earth when a picture was taken of the Himalayas. Since that first good picture on February 18th, WSU students have eagerly awaited each pass to see what new pictures of the earth will be seen. Chris reports that with each pass of WO-18, they are collecting about 100 Kbytes of data. They have now collected so much imaging data that they are running out of disk storage space.

Early in the week of March 13, WSU will be releasing its Beta test version of WEBERWARE 1.0 software for general use. This software will be available from the AMSAT Software Exchange as soon as it is released. Radio amateurs are encouraged to continue to collect imaging data from WO-18. Watch for more information about the release of WEBERWARE 1.0 in future AMSAT News Service (ANS) bulletins.

MICROSAT UPDATE

HR AMSAT NEWS SERVICE BULLETIN 055.02 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 24, 1990
TO ALL RADIO AMATEURS BT

Week five at the AMSAT Satellite Factory (tm) finds the Engineering Team focusing their attention on investigations of the spinning motion of each satellite and the accompanying effects on solar cell illumination and temperature. All four satellites have some degree of wobble motion in addition to spin and magnetic lock. Jim White (WD0E) and a number of other volunteers have put forth considerable effort aiding W3GEY, N4HY, and NK6K in evaluating the telemetry from each satellite to characterize its various motions.

AO-16 seems to have the most wobble of all the MICROSATs. It currently has a rotational period of 690 seconds (which is fairly slow) and a wobble of about 45 degrees. LO-19 takes about 270 second/rev and has a wobble of about 20 degrees. DO-17 is the most stable of all the satellites with its 20 second rotational period and a wobble of about 12 degrees. Data on WO-18 is still being analyzed. Because WO-18 has two additional trays (a total of 7 electronic platforms) its spin characteristics are more complex and will require further study.

Because of the shortage of real estate and modest power budgets, none of the MICROSATs has an active attitude control system on board e.g., magnetorquing coils such as those used on AO-10, UO-11, AO-13, and UO-14. They do, however, have a set of bar magnets placed along each of the four corners of the spacecraft which will provide some alignment with the earth's magnetic field and will ultimately damp the wobbling motion. In addition, the 70 cm antenna elements on each satellite are painted black on one side and are silver coated on the other side. The purpose of painting only one side is to generate a slight rotational torque due to solar radiation on the MICROSAT to keep the satellites rotating. This solar torque drives each satellite in constant rotation and thus prevents one part of the spacecraft from becoming too hot or too cold.

Once it has been determined that each satellite's battery charging and temperature parameters have stabilized, preliminary operating schedules will be drafted and the satellites released for general use. Look to ANS for late breaking news on the commissioning of the MICROSATs.

AO-13/AO-10 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 055.03 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 24, 1990
TO ALL RADIO AMATEURS BT

New AO-13 Transponder Schedule thru 09-May-90

Mode-B : MA 000 to MA 165
Mode-JL : MA 165 to MA 195
Mode-S : MA 195 to MA 200
Mode-BS : MA 200 to MA 205
Mode-B : MA 205 to MA 256
Omnis   : MA 240 to MA 060

BLON = 207.3 and BLAT = 2.3 for 05-Mar-90

From 21-Feb-90 to 21-Mar-90 there will be an OFF period from MA 20 to MA 90 due to solar eclipsing. The length of eclipses vary from 12 to 89 minutes. Only the Mode-S transponder and the Mode-B beacon will be on from MA 195 to MA 200.

AO-10 is currently experiencing solar eclipses during major portions of it orbit and until further notice its transponder is not available for use.

FO-20 PROGRESS REPORT

HR AMSAT NEWS SERVICE BULLETIN 055.05 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 24, 1990
TO ALL RADIO AMATEURS BT

FO-20 Progress Report

The news this week from JARL is that FO-20's electrical power subsystem (EPS) is performing better than expected. With FO-20 having been on orbit for almost three weeks, the Mode JA and JD transponders have been operating simultaneously. In the case of Mode JD, there is the additional current drain caused by having 1 Mbyte of RAM memory also on line. JARL Ground Command Station operator JK1VXJ reports that with both transponders are operating and all the RAM memory banks are on line, the power used is only slightly more than the EPS system can deliver. He also says that when FO-20 is in a full-sun condition, the EPS system can deliver the power necessary without any problem. Another interesting aspect to FO-20 life so far is the number of Single Event Upsets (SEU) or bit flips caused by high energy particles bombarding FO-20's RAM memory banks. The Error Detection and Correction (EDAC) circuitry has now recorded at least 3 to 5 bit flips due to this phenomenon. The EDAC circuitry can correct only one bit flip at a time per byte of memory.

From a Mode JD operation standpoint there is a problem that JK1VXJ would like to bring to the attention of all Mode JD users: a problem called "ZOMBI's." This term refers to stations that connect to FO-20's packet radio Mode JD mailbox system but do not send a disconnect before they have Loss of Signal (LOS). By typing the letter U when connected, JK1VXJ says he sees that there are still stations connected to the packet transponder. After a while, when the number of connected stations reaches 16, JK1VXJ says that even the Ground Command Station cannot connect! When operating Mode JD, please be sure you disconnect before LOS.

JK1VXJ reports that as of last weekend (17 February) he had reached the following milestones:

1. The BBS program written for FO-12 is now modified so that the CPU utilizes the full 4 RAM banks or 1 Mbyte total of memory. The modified BBS program was loaded to FO-20 during the February 17th weekend.

2. The ground based FO-20 software loader was also modified to improve its efficiency.

3. The ground based FO-20 engineering model is now operational and is serving as a test bed for "soon to be" loaded on-board software.

4. The Whole World Diary (WOD) function is added to BBS program and the program is being evaluated on the engineering model mentioned above. This "BBS with WOD" program will be loaded to FO-20 shortly.

SA AMSAT BACAR ATV MISSION

HR AMSAT NEWS SERVICE BULLETIN 062.01 FROM AMSAT HQ
SILVER SPRING, MD MARCH 3, 1990
TO ALL RADIO AMATEURS BT

SA AMSAT Balloon Experiment To Carry Amateur TV Camera

SA AMSAT's BACAR (BAlloon Carrying Amateur Radio) mission 90/1 scheduled for March 10 will carry a black and white closed circuit television camera that will be mounted in the flight package so that it faces towards the earth. The camera will drive a low power amplitude modulated video transmitter operating on channel 35 in the UHF television band. The output from the transmitter will provide a usable ground signal for distances up to 500 Km away from the package.

The most exciting portions of the mission will be the take off and landing as the pictures will contain most detail at these times. When the package is flying the picture on the ground will show large objects such as dams, major roads, mountains, valleys and heavily populated areas. The intention is to use a lens that will give ground coverage of some 10 Kilometers across from the altitude that the package is expected to reach.

All that will be necessary to pick up signals is a normal black and white television set tuned to channel 35 and equipped with a suitable antenna. SA AMSAT recently petitioned the South African licensing Authority for permission to use TV channel 35 as it will encourage youth groups and young amateurs who do not have sophisticated equipment to participate.

[ANS thanks SA AMSAT for this bulletin]

MICROSAT UPDATE (PART 1)

HR AMSAT NEWS SERVICE BULLETIN 062.02 FROM AMSAT HQ
SILVER SPRING, MD MARCH 3, 1990
TO ALL RADIO AMATEURS BT

MICROSAT Status Report

The work accomplished during week six of the AMSAT Satellite Factory (tm) brings closer the time when the satellites are fully commissioned for general use. Chris Williams (WA3PSD) of Weber State University reports that WO-18 Photo-04 is another keeper. It was taken over the north coast of the Bay of Bengal. It is mostly clouds, but the right side of the screen has them thinned out a bit and some faint detail of land can be decerned (with a trained eye).

AO-16's S band beacon is being activated. If a number of key telemetry parameters are within specified windows, the beacon will be left on for a period of time.

It has been determined that the power module version of the +10V bus for DO-17 is reading faulty. The AMSAT Engineering team is in the process of recalibrating it. Jim (WA4ONG) has been "manually" charging the batteries on DO-17 to top them off in anticipation of activation of the voice transmission experiment on DOVE. Jim has managed to bring the TRUE battery voltage up almost 0.5 V in a short period of time. It is hoped that this next week will bring DO-17 closer to full commissioning.

/EX

SB ALL @ AMSAT $ANS-062.03
MICROSAT UPDATE (PART 2)

HR AMSAT NEWS SERVICE BULLETIN 062.03 FROM AMSAT HQ
SILVER SPRING, MD MARCH 3, 1990
TO ALL RADIO AMATEURS BT

MICROSAT Status Report, PART 2

The AO-16 and LO-19 digipeaters have been turned on for use. Ralph Wallio, W0RPK, reports that he was able to connect to himself thru LO-19. While he was doing the normal things one does when first starting in Packet Radio such as sending yourself "Hello" and "Test" packets he received a *** Connect request from N4HY. Ralph quickly disconnected himself from himself (no comments please) and reconnected to N4HY.

On the LSTAT telemetry line now there is a new item which has the form of "d:n"; "d:0" means the digipeater is off, "d:1" means the digipeater is on. Telemetry normally comes down one each 10 seconds. When a packet is being digipeated, the time interval becomes 30 seconds. This is a compromise between those people who are using the digpeat function and those people who are looking simply to to copy the telemetry. The AMSAT Engineering Teams asks to please check the downlink BEFORE you transmit. If telemetry is coming down each 10 seconds, then look at the LSTAT line. If d=0, DON'T TRANSMIT. If you see other digipeat activity, then the digipeater is on, and it is OK to transmit. You must specify the spacecraft callsign as a digipeater to get digipeated, e.g., PACSAT-1. This is because there are multiple spacecraft on a specific frequency. N4HY advises that AO-16 and LO-19 will be unavailable at a moments notice and without warning at times as the AMSAT Engineering team is still uploading code.

Initial use of the AO-16/LO-19 digipeater has found that an AO-13 style 10-13dbi gain antenna and 10 watts are all that are needed to access a MICROSAT AT THE HORIZON. More power is not required. Deviation of your transmitter should be set to 3kHz. Also, if you can track your uplink with a program, track in the smallest units you can. Some radios can track through the serial link in much smaller intervals than can be commanded thru the front panel. Set your program to generate the data in small intervals as well. Success has been shown (using 6 seconds (.1 minute)) intervals with QuickTrak and Kansas City Tracker.

IT SATELLITE DATA BASE ANOMALY

HR AMSAT NEWS SERVICE BULLETIN 062.04 FROM AMSAT HQ
SILVER SPRING, MD MARCH 3, 1990
TO ALL RADIO AMATEURS BT

INSTATRACK Satellite Data Base Anomaly

Users of InstantTrack who acquired element sets soon after the new birds were launched should check MICROSAT and UOSAT data carefully. Until this past weekend the object names for several of the birds were incorrect. This was the result of the mis-labeling that occurred at NORAD early on. Now that NORAD has corrected the labels, the element sets are correctly tagged with the proper satellite.

The mis-labling of our new satellites by NORAD has created a mixed identity problem for InstantTrack users. For example, prior to the correction, object 20437 was identified as UO15. Well, in fact, 20437 is really UO14. However, if you have loaded recent element sets into IT you will get a satellite selection menu entry of UO15 actually loaded with UO14 elements. This problem will most likely occur with UO14/UO15/AO-16.

InstantTrack loads satellite elements by looking at the OBJECT NUMBERS and matching them to the object numbers in its database. It assumes that when you load the new elements for object 123, you want it to replace the data you presently have there for object 123. InstantTrack makes a second assumption. It assumes that when you load new elements for an object already in he database, you want to KEEP THE OLD NAME for the object. The reason for this is simple. The same object often goes by many different names. EGAP vs Ajisai. AO-13 vs Oscar-13. UO-11 vs UOSAT-2, etc.

The correct present relationship between object name and object number has been published several places recently. All you need to do is look at the name and object number for each MICROSAT. If they don't match the published relationship, then EDIT THE NAME ONLY. InstantTrack will already have loaded the correct orbital elements with the correct object number.

SILVER SPRING, MD MARCH 3, 1990
TO ALL RADIO AMATEURS BT

UOSAT-OSCAR-14 Status Report #006 2-March-90, Part I

We apologize for the long delay between the last report and this one. The team at UoS has been very busy working toward the full commissioning of UO-14 and also trying all avenues toward the recovery of UO-15.

Firstly, happy birthday to UoSAT-OSCAR-11, now completing its 6th year in orbit! Congratulations to the international team which built this successful satellite.

UO-14 Attitude Control and Stabilization

UO-14 operations for the past month have concentrated on maneuvering the satellite into an attitude suitable for extension of the gravity gradient boom. On UO-9 and UO-11, these preliminary attitude control operations were conducted mostly under direct control of the Surrey Command Station, with only simple on-board computer programs. On UO-14, these operations are being conducted autonomously by the 1802 On Board Computer (OBC). This transfer from manual to automatic control has been made possible by extensive experimentation using UO-11, and development of complex autonomous attitude determination and control algorithms in the FORTH DIARY. These operations have been going well, if a bit slowly. University of Surrey's spacecraft attitude determination and control expert, Mr. Hodgart, has extensive lecturing and administrative commitments at the University, so software modifications and data analysis have sometimes been delayed.

In our last report, UO-14 was in a "flat spin", with the spin axis lying in the orbit plane, roughly north/south pointing. The first step was to slow this spin from 18 seconds to several minutes. Once the flat spin was slowed, controllers decided to impart some spin about the satellites Z axis. This is the normal spin motion for UoSAT satellites, and it distributes solar illumination evenly between all of the spacecraft's body mounted solar panels. This assures that no undesirable thermal gradients build up across the body of the satellite. Although control of Z axis spin is a regular part of UO-11 operations, it was found that spin control of a non-Earth-pointing UoSAT required some modifications to the OBC software. The desired Z spin rate was achieved during the last week in February.

After imparting spin about the Z-axis for proper thermal control, we wish to lock the Z axis to the Earth's magnetic field. Because of the alignment of the field, magnetic locking places the satellite in a favourable attitude for boom deployment as it makes descending passes over Guildford. Thus, once the satellite locked to the magnetic field, the boom will be deployed within range of the Command station, the magnetic lock software will be disabled, and the satellite should become gravity gradient stabilized. These operations are expected early next week (12 March).

UO-14 Status Report #006 2-March-90, Part II

Data Formats

UO-14 continues to run the FORTH DIARY on the 1802 OBC, using data formats distributed just after launch. The development, publication and implementation of downlink data formats for OSCARs is a delicate business, especially early in a mission. We do not want to publish data formats if they are likely to change quickly, lest people waste their time implementing software which will later become useless. On the other hand, if we do not publish formats, you cannot listen to the satellites - and that's what they're there for!

In the next month, we will be changing operating regimes on UO-14, as the PACSAT Communications Experiment (PCE) is brought on line. Once this happens, asynchronous data formats (as used by the DIARY) will give way to synchronous, AX.25 packet formats.

As soon as possible, the PCE on UO-14, and the BBS systems on AO-16 and LO-19 will be brought on line for general amateur store-and-forward communications access. All three of these satellites will be running the same software, using the same protocols - developed jointly by UoSAT and AMSAT-NA. NK6K and G0/K8KA have already published a draft standard for a broadcast (e.g. bulletins and Whole-Orbit-Data) protocol. A final specification should be distributed soon, and early transmissions from the UO-15 PCE will use this protocol. Specification of the message-transfer protocol is well under way.

Thus, the stable state, which we expect to reach sometime this spring, is that UO-14, AO-16 and LO-19 bulletin boards will be accessable with the same groundstation protocol software. Broadcasts from these satellites (e.g. bulletins and Whole-Orbit Data) will also come down in a single standard data format. Until we reach this state, ground station software developers are advised to make their programs modular and be ready to revise!

Downlink Modulation

UO-15 is capable of transmitting either 1200 baud AFSK (as used on all previous UoSATs and currently transmited by UO-14), or 9600 bits/second FSK. Ultimately, the PCE on UO-15 will support only 9600 bps FSK. During the transition from DIARY operations to PCE operations, however, we will also be transmitting AX.25 packets at 1200 bits/second AFSK. Like DOVE, this should be copyable with a standard, unmodified, TNC.

[AMSAT News Service would like to thank G0/K8KA for this bulletin.]

SILVER SPRING, MD MARCH 3, 1990
TO ALL RADIO AMATEURS BT

UO-15 Status Report #006 2-March-90

Experiments are under way using a large (150ft) antenna at Stanford Research Institute (SRI) to attempt to detect very low level signals leaking from the UO-15's on-board uplink receiver local oscillators. If the spacecraft power systems are still functioning, then these signals should always be present since the receivers cannot be switched off. However, these leakage signals are deliberately minimized during the design of the satellite and so they are very weak (-60 dBm = one thousand, millionth of a watt or the equivalent to looking for a single Xmas tree light in Australia!). The experiments at Stanford are therefore very demanding: it will only be possible to extract the signals from the background noise using sophisticated off-line digital signal processing, and a one second error in antenna tracking time may miss the satellite altogether!

Fortunately, we have UO-14 working well, and this sister satellite can be used as a "reference" to determine whether it is in fact possible to detect these signals even if UO-15 is alive (UO-14 & 15 use identical systems). After much processing, SRI successfully detected the leakage signal from UO-14 on Feb. 26th at the expected levels, and attempts to listen for UO-15 have just commenced. It may still take several weeks before the results are conclusive, since great care has to be taken to remove all sources of error and uncertainty. If the leakage signals are detected from UoSAT-15, then further tests are planned which should allow us to trace the nature of the fault.

[AMSAT News Service would like to thank G3YJO for this bulletin.]

CC: PACLIST

Further on motion...

Analysis of array currents has indicated that PACSAT-1 (AO-16) came out of its tumbling motion after separation spinning in the wrong direction. Because of the dynamics of the separation from the launch vehicle, there was a 50 - 50 chance of that happening with any of the microsats. Once it had locked into the magnetic field of the earth, about 10 days after launch, it began to slowly spin down from about a 10 minutes per revolution rate, to 30 minutes, to 1 hour, then on Feb 17th it essentially stopped all spinning motion for a couple of orbits, then began to turn in the opposite (correct) direction. As of March 3 it had spun back up to about 7 minutes per rev in the correct direction and will probably stabilize at that rate, which is the same speed at which LUSAT-1 (LO-10) is turning. A change in the telemetry gathering method will be necessary to determine if the wobbling motion, much like a top that is a bit out of balance, has been reduced from the 45 degrees measured in early February.

SILVER SPRING, MD MARCH 10, 1990
TO ALL RADIO AMATEURS BT

WEBERSAT-OSCAR-18 Picture Taking Continues; Weberware 1.0 Goes To Beta Test

WA3PSD reports that the Ground Command Station at Weber State University (WSU) is receiving pictures from space on a daily basis. This past week the best picture taken was of the coastline of British Columbia near Vancouver Island. Since Weberware 1.0 has the capability to recover the color in pictures from the imaging data stored in memory, the oceans show up with the proper hues as seen by the camera. Initially it was difficult for the WSU students to pin-point the area snapped by the camera, but checking with QUIKTRAK the time the lens shutter was opened, they determined that it was the coastline of British Columbia. The camera on WO-18 can only take a 170 square mile picture (when looking straight down), so at times one has to be very good at geography. Horizon sensor readings are being integrated into the picture taking software on-board WO-18. The horizon sensors can be interpreted to determine when the satellite is pointing at the earth. The software is being changed so that pictures will only be taken at those times. Hopefully, this will mean the end to pictures of deep space or the sun.

WO-18 may be heard on 437.100 MHz (+/- 10 KHz for doppler shift). The alternate frequency is 437.075 MHz.

WA3PSD is pleased to announce that the beta test version of the picture processing software, Weberware 1.0, will be sent out to a group of carefully choosen software testers next week who will perform intensive checks of the software. If no major bugs are discovered radio amateurs can expect to see Weberware 1.0 available from the AMSAT Software Exchange around the first week of April. WA3PSD wants to emphasis that the first priority at WSU is taking care of WO-18 -- after that, getting the image processing software finished is next. The students at WSU are working as quickly as possible to get this very complicated program into a user friendly state. Weberware 1.0 is designed to run on IBM AT clones equipped with EGA or VGA monitors.

Because of the instant popularity of WSU's efforts in the building the WEBERSAT MICROSAT, many grade school and high school students from the greater Ogden/Salt Lake City area are showing up at the Ground Command Station in the evenings to see what is involved in the care and feeding of an OSCAR satellite. The WSU students have enthusiastically embraced the job of explaining to all who enter the finer details of WO-18 and its many on-board scientific experiments. It is hoped that many of these young people will not only become interested in amateur radio but also start thinking about space.

All radio amateurs are encouraged to continue to save picture data from WO-18 and telemetry. If you would like to receive a beautiful QSL card from WSU, send your QSL card, a copy of WO-18 telementry and a s.a.s.e. to:

TO ALL RADIO AMATEURS BT

Operational Coordinator for Orbital Data Management Appointed

AMSAT-NA V. P. of Operations, Courtney Duncan, N5BF, announces the appointment of Dick Campbell, N3FKV, AMSAT Operational Coordinator for Orbital Data Management. Dick has already assumed his initial responsibility of collecting, reformatting, and releasing keplerian orbital data for satellites of interest to amateur radio operators on a weekly basis.

As AMSAT continues to progess into an era of tracking and utilizing over a dozen satellites (plus weather satellites), Dick will work to improve both our sources for this information, intermediate processing and checking, and our distribution networks to maximize the usefulness of the information for all involved.

Comments and suggestions should be forwarded to:

Dick Campbell, N3FKV
216 Coventry Drive
Lorena, Texas 76655

Dick does not currently live near a packet BBS so packet mail on the subject of AMSAT Orbital Data Management may be forwarded to him via N5BF @ WB6YMH.

ORBIT DATA CHANGES CONSIDERED

HR AMSAT NEWS SERVICE BULLETIN 069.03 FROM AMSAT HQ
SILVER SPRING, MD MARCH 10, 1990
TO ALL RADIO AMATEURS BT

The number of satellites tracked and used by radio amateurs is more than doubling during 1990 and so are the demands on the distribution networks for orbital information. As a result, AMSAT-NA is interested in quantifying its user base and determining their requirements as plans are made to improve the system.

Already, many AMSAT and AMSAT related publications have gone from the familiar "AMSAT Standard" format to the more compact NASA "two line" format to save space. Consideration is also being given to changing to this format for packet radio distribution. For users of PC compatible computer systems with the popular Quiktrak, InstanTrak and Graftrak tracking programs, this poses no problem. These programs are able to make automatic updates of keplerian data from files captured during packet BBS or dial up BBS sessions. Older versions of these programs, programs for other types of computers, and software used in other parts of the world do not have these features, however, and AMSAT is interested in determining exactly what information and formats it should be providing to its broad user base. Interested users are asked to answer the following questions and respond to one of the addresses given below.

NAME ___________________

CALLSIGN ________________

ADDRESS _________________

What computers, calculators, or other tracking aids do you use for amateur or weather satellite tracking?

What tracking programs do you use?

What type of orbital data do you use? (AMSAT sets, NASA two-line, equator crossing time and longitude, other - please describe).

How often do you do orbital data updates?

How do you perform these updates? (Manually, tracking program utility)

How many and which satellites do you maintain in your database? How many do you routinely use?

Where do you obtain your orbital data? (AMSAT Nets, Packet BBS, printed publications, mail from NASA, other - please describe).

Please send replies to:

Dick Campbell, N3FKV

SEARCH FOR UO-15 FAILURE MODE CONTINUES

HR AMSAT NEWS SERVICE BULLETIN 069.04 FROM AMSAT HQ
SILVER SPRING, MD MARCH 10, 1990
TO ALL RADIO AMATEURS BT

Volunteers at the Stanford Research Institute (SRI) have been working with the University of Surrey (UoS) to try to determine what may be preventing UO-15 from downlinking telemetry. Martin Sweeting of the UoS reported that SRI is making available a 150 foot dish and its sophisticated signal processing equipment to determine if any of the sub-systems on UO-15 are still operational. If you will remember, SRI has aided UoS in the past by using the same dish to uplink a signal of "sufficient strength" to overcome the desensing of UO-9's command receiver when its two meter transmitter was erroneously turned on.

The signals SRI are trying to receive are the local oscillators on board UO-15. It has been calculated that the receive signal strength of UO-15's LOs are approximately -160 dBm (talk about small-signal work!). A trial run this week of receiving LO signals from the healthy UO-14 was deemed successful, although it required signal analyzers utilizing FFT techniques that provided a 1 Hz resolution bandwidth over a 5 KHz BW to discern the signals. SRI will now try to locate UO-15's LO signals over the next week and from the results of those efforts, the University of Surrey's engineering team will make a determination if it is possible to "pull the cork" on UO-15's transmitter.

MICROSAT UPDATE

HR AMSAT NEWS SERVICE BULLETIN 069.05 FROM AMSAT HQ
SILVER SPRING, MD MARCH 10, 1990
TO ALL RADIO AMATEURS BT

Week seven at the AMSAT Satellite factory finds each satellite closer to full commissioning for general use. DO-17 continues to excite newcomers to the world of Amateur Satellites with its ease of telemetry reception. Anyone with a 2 meter FM receiver tuned to 146.825 MHz, a 1/4 wave ground plane antenna (there is no tracking required with this antenna!) and a standard TNC will be able to receive telemetry packets from DO-17. By listening from 8:00 am through 1:00 am and 7:00 pm through 12:00 am local time, you should be able to pick up a number of passes of DO-17. DO-17 transmits packets for about 2.5 minutes followed by an "off period" of about 30 seconds. As is the case with each of the Microsats, the telemetry offers 59 telemetry points and the AMSAT Software Exchange has available programs that translate the data points into more easily recognizable information (ie: battery voltage, solar cell current etc.).

AO-16 and LO-19 have been available for digipeating packets. Numerous stations have successfully connected to "DX" (as far as VHF-packet operations is concerned) via these two birds. The Store and Forward capabilities of AO-16 and LO-19 have yet to be enabled, pending further testing.

The modulation protocol on these two birds is as follows. The TNC must use an external 1200 baud PSK modem rather than the FSK modem that is standard on commercial TNCs. Approximately 100 watts EIRP FM is all that is required to access AO-16 or LO-19. Your downlink receiver must be set to USB or LSB. To digipeat through AO-16 you must use the address PACSAT-1. To digipeat through

LO-19 you must use the address LUSAT-1. Below are listed the downlink and uplink frequencies of AO-16 and LO-19:

AO-16	Downlink	437.025	437.050	MHz		
	Uplink	145.90	145.92	145.94	145.96	MHz
LO-19	Downlink	437.150	437.125	MHz		
	Uplink	145.84	145.86	145.88	145.90	MHz

UOSAT-OSCAR-14 and UOSAT-OSCAR-15 REPORT #007 15-Mar-90

** UoSAT-OSCAR-14 **

Attitude Control and Stabilization

Manueuvers prior to gravity gradient stabilization have taken somewhat longer than expected. The most recent delays were caused by the need to add digital filters to the attitude determination software to remove unwanted noise from the magnetometer readings. The filters have been installed, and a new version of the FORTH diary will be uploaded soon.

High Speed Downlink Tests

The UoSAT Command Station has been conducting limited experiments with the

9600 bits/second Frequency Shift Keyed (FSK) downlink on UO-14. These tests have been quite successful, doubling the highest digital link speed previously used on any OSCAR satellite (4800 bps is routinely used on UO-11).

Data transmitted during these tests has been either asynchronous telemetry from the Very Large Scale Integrated telemetry system or continuous streams of 1 bits (no data at all). The "stuck ones" tests are very useful because of the scramblers in the modulator and demodulator. The 1's are scrambled and transmitted as pseudorandom data over the RF link. The groundstation demodulators then lock onto this data, descramble it, and reproduce the continuous 1's. Any 0's in the demodulated output data stream are caused by bit errors on the communication link, and the link bit error rate (BER) can be calculated from the frequency of such transitions.

BER tests are to be scheduled into the DIARY in aid of those trying to test their FSK receive systems. The first scheduled tests were scheduled for the morning passes over the East Coast of the US on 15 March.

- de G0/K8KA.

** UoSAT-OSCAR-15 **

The team at Stanford has succeeded in detecting local oscillator (LO) leakage from the UO-15 command receiver. The weak signals were first detected on March 10 and then again on March 11. Roy Long, leading the Stanford Research Institute team on the recovery attempt, said that there is no doubt that the signal comes from UoSAT-15. It is weaker than the corresponding signal on UoSAT-14, as expected from prelaunch measurements.

Each UoSAT carries three receivers: a fixed-frequency command receiver and two communications receivers with switchable frequency. Efforts will now concentrate on monitoring one of the switchable frequency receivers. If one of these receivers is heard, commands will then be sent to change the receiver frequency, which should cause a corresponding change in the LO frequency. Observation of changed LO frequency will confirm that the satellite's command system is basically healthy.

The work at Stanford is very time consuming, requiring azimuth and elevation control of the huge Stanford 150 diameter dish to within tight limits. Data are collected for only a few seconds, followed by hours of post-processing.

DOVE-OSCAR-17 OBC CRASHES

HR AMSAT NEWS SERVICE BULLETIN 076.02 FROM AMSAT HQ
SILVER SPRING, MD MARCH 17, 1990
TO ALL RADIO AMATEURS BT

DOVE-OSCAR-17's On-board Computer (OBC) Experiences A Crash

On Wednesday March 14, reports were received that an On-Board Computer (OBC) crash had occurred on DOVE-1. Since then, only a continuous carrier with packet "flags" has been heard on the DO-17 downlink of 145.825 MHz. At the present time it has not been determined exactly how this computer anomaly occured. Attempts are being made to perform a reset of the DOVE-1 CPU.

At the present time the MICROSAT Engineering Team does not feel this condition poses any threat to the well-being of DO-17. After several command tests, the anomalous situation will be better understood. If a reset attempt is succesful, the S band transmitter will be commanded on and two meter transmissions will be suspended until after the next software upload is completed. Data reports from S band receiving stations will be crucial during the period following the reset. Stations equipped to receive 1200 bps PSK on 2400.1 - 2400.3 MHz should contact Courtney Duncan, N5BF, or Bruce Rahn, WB9ANQ via the AMSAT-NA Operations Net or AMSAT-NA Headquarters. Also, data reports from shortly before the CPU crash will be appreciated. For information on submitting reports, see the following ANS bulletin concerning the Microsat Data Archive.

Stay tuned to AMSAT Nets and ANS bulletins for further updates.

SB ALL @ AMSAT $ANS-076.03
MICROSAT DATA ARCHIVE ESTABLISHED

HR AMSAT NEWS SERVICE BULLETIN 076.03 FROM AMSAT HQ
SILVER SPRING, MD MARCH 17, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Vice President for Operations, Courtney Duncan, N5BF, announces the appointment of Reid Bristor, WA4UPD, Technical Coordinator for Satellite Data Archiving.

Reid has set up a database using DEC computers and large, removable fixed disk drive systems and is now ready to begin receiving data for collating and storage. Microsat files collected in either KISS or ASCII mode are acceptable. File naming is not yet standardized so any convention is ok as long as submitters include a note explaining how their personal naming convention works. A standard format for file naming and file contents will be published soon after which all submissions must conform. At this time, all Microsat datafiles are welcome.

This archive will be used to keep records on the Microsat spacecraft over short and long term periods and to allow various spacecraft parameters and trends to be analyzed. Clearly, any such research will benefit from the most complete dataset possible, thus, it is very important that everyone with captured data send copies to Reid for inclusion in the master archive. Command and monitoring station operators are very dedicated individuals but they all have careers, families, and other responsibilities and have not been able to take data for every visibility of every satellite since launch. Also, each satellite is only visible a small percentage of the time from any given location. There is no single, complete collection of Microsat telemetry data; AMSAT is counting on the many amateur satellite users around the world who have been logging data for the last two months to begin this collection. There is a good chance that the data submitted by any individual is unique and therefore very important to the collection. Submissions are solicited from North and South America, Africa, Europe and Asia, Australia and Oceania, and any other locations for all times since the Microsat launch.

As the system developes, it will be expanded to include other amateur satellites besides the Microsats. Submission standards will be published and amateurs wishing access to the data for analysis and research will be accomodated.

Reid is prepared to take submissions by mail in any of the IBM-PC 5.25 or 3.5 inch disk formats, Commodore-64 1541, 1571, and 1581 formats, and DEC RX-50 and RX-01/2 formats (as used on the Rainbow 100 and PRO series DEC systems). Those with disks in Apple, MacIntosh, or any other formats not listed are asked to write to Reid at the address given below to work out the details of data submission. Files may be compressed using PKARC. Direct, electronic submission of data may be instituted in the future if it is deemed practical.

Data diskettes, inquiries, comments, and other correspondence concerning the Microsat / Amateur Satellite Data Archive may be directed to:

Reid Bristor, WA4UPD @ N4JLR
4535 Deerwood Trail
Melbourne, Florida 32935

Reid also participates regularly in the Amsat-NA Operations Net on AO-13 and can be contacted there.

AO-10 & 13 TRANSPONDER SCHEDULES

HR AMSAT NEWS SERVICE BULLETIN 076.04 FROM AMSAT HQ
SILVER SPRING, MD MARCH 17, 1990
TO ALL RADIO AMATEURS BT

AO-13 Transponder Schedule to 09May90

Mode-B : MA 000 to MA 165
Mode-JL : MA 165 to MA 195
Mode-S : MA 195 to MA 200
Mode-BS : MA 200 to MA 205
Mode-B : MA 205 to MA 256
Omnis : MA 240 to MA 060

BLON = 207.4 and BLAT = 1.7 for 19Mar90

The Mode-B beacon will be ON from MA 195 to MA 200. However from 21Feb90 to 21Mar90 there will be an OFF period from MA 20 to MA 90 due to solar eclipses affecting AO-13. The length of the eclipses vary from 12 to 89 minutes. Only the Mode-S transponder & the Mode-B beacon will be ON from MA 195 to MA 200.

AO-10 is currently experiencing solar eclipses during major portions of it orbit and until further notice its transponder is not available for use.

SA AMSAT BACAR MISSION 90/1 A HUGE SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 076.06 FROM AMSAT HQ
SILVER SPRING, MD MARCH 17, 1990
TO ALL RADIO AMATEURS BT

BACAR mission 90/1 was a huge success. Three balloons carried BACAR (BAlloon Carrying Amateur Radio) to a height of nearly 50,000 feet above sea level in what can be described as a flawless mission.

BACAR was equipped with an RTTY telemetry unit providing information such as current altitude and rate of climb. The telemetry transmitter's output was in the 2 meter band. The camera used was a closed circuit monochrome CCD television camera fitted with an 8.5 mm lens. The camera had an automatic gain control circuit which compensated for the variation in light intensities. The video output from the camera was fed into a video transmitter operating on standard UHF channel 35 (583.250 MHz). The transmitter consisted of a crystal controlled oscillator on 48 MHz which was multiplied up to the output frequency. Modulation was applied to the driver and output stages which then drove a co-linear ground plane antenna. The output of the transmitter was 1.7 watts. BACAR was powered by common alkaline batteries.

With an expensive camera on board, special precautions were taken to ensure that BACAR would be recovered. A special release mechanism was used that automatically released BACAR from the balloons 90 minutes after launch. As a further safety precaution, a telecommand receiver was also built into the device.

The local weather bureau provided tracking support and other logistical assistance. The launch went off like clockwork and seconds after BACAR started to ascend, reports of good quality video were received. Later in the flight video reception was reported from as far as Pietersburg, a city over 300 km from the launch site. Reports and video tapes are still being received.

[ANS would like to thank SA-AMSAT for this information]

V51NAM On AO-13 From Namibia Until March 25th

Hans an de Groenendaal (ZS6AKV) reports that on March 20th Namibian radio amateurs will start to use their newly allocated callsigns as follows:

Old Prefix	New Prefix
ZS3 Full License	V51
ZR3 Restricted VHF License	V50

As part of this change in call signs, special event station Z51NAM will be on AO-13 working as many stations as possible until March 25th. For those who make a contact with V51NAM and would like to QSL, send your QSL card to the:

South African Amateur Radio League
BOX 807
Houghton 2051, South Africa

The SARL will be handling all QSL's on behalf of the Namibian Amateur Radio Society. The President of the Namibian Amateur Radio Society is Derek Moore, ex ZS3DM.

MAC TLM PROGRAM AVAILABLE

HR AMSAT NEWS SERVICE BULLETIN 083.03 FROM AMSAT HQ
SILVER SPRING, MD MARCH 24, 1990
TO ALL RADIO AMATEURS BT

MACINTOSH MICROSAT Telemetry Decoding Program Now Available

Jim White (WD0E) reports that his TLMDCMac program is now available from the AMSAT Software Exchange. TLMDCMac is a Macintosh application that decodes telemetry (TLM) from any of the four AMSAT MICROSATs (AO-16, DO-17, WO-18, LO-19). It takes the values that are transmitted by the satellites and transforms them into "engineering values" that indicate how the spacecraft is operating, i.e., the RF power output of the transmitters, temperatures, current being generated from the solar arrays, etc. The telemetry data can be viewed live on the Mac screen during a MICROSAT pass by connection from your TNC to one of the Mac serial ports. You can also record the TLM and read it into TLMDCMac later. Recorded files must be in ASCII text (no KISS) and can be from any source. The program displays the raw TLM data and the decoded values (in Amps, degrees C, etc.) in two separate resizable, movable windows on the Mac screen. Decoded values are displayed in logical groups. It can also, at the user's option, create three separate output files: The raw TLM, the decoded values in a tabular format (probably not available in V1.0), or the decoded values in the SYLK format. The latter can be read into most any spread sheet application for further analysis, charting, etc. Included with the program is a Parameter Converter application for updating the files of parameters used to decode the raw TLM, the parameter files themselves, and a set of EXCEL templates in which data can be pasted into for further analysis. A complete user guide and some sample TLM files are also included. A Mac 512E, Plus, SE, Mac II, or Mac Portable can be used. For further information about the availability of this program, contact the Software Exchange at (301) 589-6062.

DO-17 RECOVERED BY EME STATION

HR AMSAT NEWS SERVICE BULLETIN 083.06 FROM AMSAT HQ
SILVER SPRING, MD MARCH 24, 1990
TO ALL RADIO AMATEURS BT

W5UN's Big EME Station "Gets" DOVE's Attention!

On Saturday, 17-Mar-90 the AMSAT Engineering Team successfully reset the CPU on DO-17 and commanded the 2M transmitter off. Dave Blaschke (W5UN) is the owner of the world's largest privately owned 2 meter antenna and was teamed with Harold Price (NK6K) to overcome the desense problem (DO-17's command receiver is also in the 2M band and the constant "streaming" by the transmitter desensed the command receiver). Even with 32.5 dBi gain, and nearly 2 megawatts of EIRP, it took Dave and Harold several days of transmitting the reset sequence before they were successful.

Alberto Zagni (I2KBD) reported that the transmitter power was dropping significantly at the end of the eclipse portion of the orbit which indicated that the batteries were flattening out. Armed with this information, Bob McGwier (N4HY) strategized with W5UN as to the two best times to reset the spacecraft CPU and turn the transmitter off. The first was at the end of the eclipse period, when transmitter power would be at its lowest point. However, if it turned out that the battery voltage was too low to maintain the GASFET preamp in the receiver, then the next time to try was just as the transmitter power was falling off (soon after it left the sun and started the voltage descent in eclipse). The latter was the time which turned out to be successful.

Almost immediately following the reset, NK6K uploaded a new set of battery charging commands and transmitter state commands. Early the next morning, Bob commanded the S band transmitter on and the two meter transmitter off. Bill McCaa, K0RZ, successfully copied the S band beacon. The AMSAT Engineering Team is reviewing the events of the last week to determine the failure mode. Once they have completed their investigation, they will upload the operating system for DO-17 and continue its shakedown prior to commissioning. DO-17 is not expected to be fully commissioned until sometime in April.

Johnson Space Flight Center to Host 1990 AMSAT Symposium

AMSAT has announced that the 1990 AMSAT Space Symposium will be held at NASA's Johnson Space Center near Houston Texas. The dates for the weekend meeting which will be hosted by the Johnson Space Center Amateur Radio Club, W5RRR, are October 19, 20 and 21.

Registration will open on Friday afternoon at the nearby King's Inn, and tours of the Center will be possible only on Friday and Monday. The tour includes areas such as Mission Control, the Shuttle Mock-up facility as well as the "Zero-G" Tank, a massive swimming pool used to train mission specialists for Shuttle Extra Vehicular Activities (rubber rafts are not allowed and space suits not necessary).

The Symposium will take place on Saturday in the Visitor Center's Main Auditorium. It is sure to be a day packed with talks and presentations on various amateur satellite and related projects. The day will conclude with a Texas-style Bar-B-Que and the AMSAT Banquet.

Many details have still yet to be worked out, but if their schedules allow, Ron Parise (WA4SIR) Mission Specialist on the upcoming STS-35 mission and Ken Cameron (KB5AWP) the Shuttle Pilot on STS-37 will be in attendance. Ken's mission is presently scheduled to be launched approximately two weeks following the annual meeting, so he may have late inside infomration on how he plans to operate during his mission.

Mark your calendar (using a pen) and make plans to attend this year's AMSAT Symposium. This is the "Year of the Amateur Satellite" and if you haven't gotten involved in the Amateur Space program, this would be an excellent way to find out what it is really all about. This is sure to be one of the most exciting Symposiums ever.

MIR Space Station Amateur Radio Operations Expected To Resume

AMSAT has received information from reliable sources that Soviet cosmonauts Anatoly Soloviev (U6MIR) and Alexander Balandin (U7MIR) may have resumed amateur radio activity from MIR, the Soviet Space Station. They are reported to be transmitting in 2 meter band primarily on 145.50 but may also be found on 145.550 MHz. The most probable time of operation is after 18:00 UTC and any time on weekends.

It was reported that the new radio brought up by the new operators has broken down and that Anatoly and Alexander were using the old equipment left by U2MIR and U4MIR. There are plans to replace the broken rig in the near future, possibly on an unmanned supply mission.

QSLs can be sent via bureau or direct to their QSL manager UW3AX at: P.O.Box 679, MOSCOW 107207, USSR. If you send a card direct, they request an IRC and a self-addressed envelope.

I'll throw my few cents in. I own a MFJ tunner, one of the 949 series, and an antenna bridge. They both work fine and do the job required. I would say that the value is there for what I paid. The antenna tunner certainly does not compare to a Nye-Johnson tunner or a Ten-Ten tunner, but hey for the money it does the job fine and has an acceptable quality level. Same goes for the antenna bridge. I have tunned up several antennas with it without a problem and for the amount of use I give it I can not complain about the performance. This V31BB character apparently did not talk to MFJ. If he has a complaint about the product he should at least give the manufacturer a chance to respond instead of taking his complaints public. As I recall, several months ago a person on this net was complaining about a speaker/mike. About a week later he posted an apology, seemed MFJ found out about his problem and sent him a new speaker/mike no questions asked. I would buy a MFJ product again with out hesitation. They provide a good product at an affordable price.

I am considering renewing or starting subscriptions to various HAM magazines,
and would appreciate comments or suggestions.

My priority list goes something like this:

1) Technical content
2) Technical content
3) Technical content
4) Operating practice, band openings, etc
...
98) Contests
99) Silent Keys (unless I am listed; that would concern me :-(

QST, Ham Radio, and 73 Magazine are locally available, so I have a pretty good idea of their content... how about QEX or others I may not be aware of? Any good newsletters?

How about it, fellow hams?

> With KZ5 stations, you will have a problem, since those were military personnel stationed in the (then) U.S. Canal Zone. However, there are ways to track at least some of these folks down, assuming they're still alive and licensed.

Exactly. A friend of mine tracked down a KZ5 card by looking him up in an old KZ5-era callbook. Once you have the guy's name, you can look him up in a sorted-by-lastname-callbook or use one of these callsign-servers on the internet. If he has a current USA ticket, you've got him! These listings also include birth date. So if your KZ5-blah-blah is named Robert Smith, you can probably eliminate any Robert Smiths who were born after 1960, unless your Robert Smith was a military dependent kid ham.

This method is good for tracking down any US amateur who was hamming overseas at one time, but it is particularly good for KZ5's who were mostly US people.

Oh. And one last comment. This method is not limited to US hams -- it's just easier with US hams. For instance, if you are tracking down a card from Angola, go look in an old callbook and find the guy's name. Then go look at the Portugal listings (exhaustive search, yuck) in a current callbook. Then send the guy a letter and a QSL. Get the picture?

He was/is a real character, sure enough. The late Arthur Godfrey, K4LIB, who
was a general in the USAF Reserve, was a friend of his. He told of a hunting
trip he, LeMay, and others went on out west. They split up to cover more
territory. Godfrey spotted a deer and fired. He missed. He fired again. He
missed again. By this time the buck realized he was in no immediate danger from
Godfrey and proceeded to calmly walk across the clearing, grazing as he went.
Godfrey kept firing and missing, 6 or 8 shots all told. In disgust, Godfrey
gave up and went back to the place they had parked the Jeep. LeMay was there
chewing on his cigar and breaking down his rifle. Without looking up he calmly
asked "Well, Gen. Godfrey, did our boys take that hill?"

Art Collins had given LeMay a complete Collins SSB station for his home use and
LeMay was so impressed by the effectiveness of SSB that he became instrumental
in getting the Air Force to switch to SSB. Needless to say, this led to Collins
selling the government million$ in KWM-2's and 30L's.

>
> Barry Goldwater, Curtis LeMay... how come the hams who rise to prominent

Just thought I should mention that Ham Radio is again getting some free advertising. Worcester Telegram published a large article in the Sunday, March 18, 1990 paper about a local radio club. Mostly, it discussed the Emergency Preparedness aspect of ham radio, but also discussed some of the more fun things, like DXing, etc. It was a pretty good article and even had a picture of a local ham at his shack.....only one bad comment..... they spelled one of the names wrong....it's Cayen, not Caen. Ah, well...

(PS, for those who don't know, Worcester is in Massachusetts)

From Gian Moda, I7SWX   19-MAR-1990 03:18

**** ITALY ON 50 MHz ****

The Italian PTT has released to italian hams the 50MHz band, after long work of A.R.I. and a positive ok by the Italian Ministry of Defence, with a doc.n. 11422 dated 6 march 1990, but with the following conditions :

- Frequency : 50,157.5 MHz +/- 6,250 Hz with a total band of 12,5 KHz
- Maximum RF Output Power : 10 W
- Service : Secondary (this band is used by Army services)
- Authorization : Following a request to the PTT Authority by single operator or group of operators (only full privilage licencees)
- Time-period : 1 year with possible renewal.
- Modes : A1A (CW but no modulated telegraphy) and J3E (Single Side Band but only upper band : USB)
- Absolute frequency limits : 50,151.250 MHz and 50,163.750 MHz
- It is forbidden the activity of beacons, FM emission or other modes (Packet and others).

It is the beginning for italian hams but we must be very careful not to go "outside" of the PTT guidelines to avoid any possible negative reaction for the renewal and possible extension of band.

Soon (time to get the authorization) several italian call-sign will be heard on 50 MHz. Please spread the NEWS.

73 de I7SWX - Gian MODA (one of those that requested the special permit).

%domestic HF privileges.  The international code test requirement does
%not apply to domestic communications.  Two simple solutions come to
%my mind:
%
%  1. give the Communicator class all the present Novice/Technician HF
%     privileges, but restricted to domestic communications only.
%
%  2. require Communicator class applicants to pass the General class
%     written exam, and give them all General class privileges,
%     but restricted to only domestic communications on HF.
```

%
%I prefer option 2, but option 1 is the least we can do, as I see it.

Sure, how do you police it? Remember that CB was supposed to be
"domestic communication only" and "line of sight" only. Now you can
hear just as good DX on 11 metres as you can on 20!

Just a personal opinion but if children of 7 years of age, and people
of 75 years of age can learn International code at 10 wpm (the current
Canadian requirement for HF priviledges) then I don't see how anyone
can not learn it at 5 wpm! A lot of the trouble is that people just
don't want to be told you *have* to do something. Just an opinion.

BTW, I am not an objector to a no-code intro level licence, there is a
VHF only n0-code going into effect here next September and I think it
will be a benefit to the hobby but I can see all sorts of problems with
a no-code HF licence.

S6Does anybody have a recommendation for a qsl card
S6maker? I just got my ticket and have already started
S6receiving some from others so I guess I need to get some
S6soon. I've seen some little adds in the magazines, but
S6I'm looking for personal recommendations.

Well, for price/quality/value I'd go with W4MPY's cards. The quality
is good, the price is reasonable. The quality/price ratio is also good
for K2RPZ Print. There is also an excellent printer in the UK but with
the cost of the pound and shipping it isn't worth it any more.

Personally, I use my local printer. I looked through my cards and found a reasonable design, took it to him and he made up a proof before printing it and the cost was better than anything I could mail order.

Hope it helps!

To: XB.P07@forsythe.stanford.edu (Bryan Pfaffenberger)
Subj: Ham Operator Profile

Bryan,

Interesting as I did something similar during my undergrad work in social psychology.

>a) What are the distinctive social values of ham radio people? Do
>they tend to prefer hierarchical or egalitarian group structures?

Generally, groups within the hobby (clubs etc) are egalitarian structures. There is a minor heirarchy in the sense that those in the hobby longer tend to find themselves in a "mentor" capacity on occasion. Special groups such as those involved directly in emergency public service work have a more heirarchical structure but this is more of a necessity imposed by function than desire (although like any group of people hams are not immune from the desire to be boss <grin>).

>b) How to ham radio people relate to technology? Is there a
>sharing ethic like one finds in computer user's groups?

Many computer users groups started as groups of ham operators. The local commodore group is a public spinoff of the local radio club's user group - the first in our area. The sharing ethic is very evident in the hobby in general. Many advances in technology in the past and in the present have come from hams, either through their hobby or their jobs. Many are engineers, technicians and technologists. Many are involved in aerospace and have had a major impact on sattelite research.

>c) What are the ideals of social service that ham radio people
>espouse? Is involvement with the technology supposed to serve some
>greater good than just amusing oneself with a fascinating and
>rewarding hobby?

This question will elicit many responses. The old premise underlying the hobby was one of providing experimentation and developement in radio related fields and in providing a trained and knowledgeable cadre of radio operators in times of emergency. While much of the experimentation has been diluted for many hams there are many more who enjoy developing new applications and uses for the technology available. Most operators are willing to help out in emergencies and public service and many go out of their way to do so.

>Sorry for the naivete of these questions! But that's what makes
>good anthropology--you're brave enough to ask dumb questions. Will
>appreciate all responses.

Not naive at all for those not involved with the hobby. Most of us love to sit and talk be it about ham radio or anything else and you are likely to get many responses of varying nature.

The above opinions are those of myself and many friends I have met both personally and on the air over the years. There are differing opinions on some points, especially whether or not we serve some greater good, but this is the nature of man.

>"To the degree that he masters his tools, he invests the world with
>his meaning; to the degree that he is mastered by his tools, the
>shape of the tool determines his own self-image." Ivan Illich

It could be said the above applies to ham radio operators, a very apt quote Bryan.

Hope to chat on the air someday.

RHAREL%FAB8@SC.INTEL.COM ("RICHARD HAREL CAL.LAB INTEL") writes...
>Can anyone give me some feedback as to what speeds data transfer is
>achieving these days over:
>a. Conventional Telephone lines

Given a 30 dB S/N ratio and 2.6 kHz usable bandwidth, Shannon says you get about 26000 bps LIMIT (theoretical, not achievable) of modem technology. Contemporary voiceband dial-up modems (V.32) get 9600 bps but send and receive over the same wire. Private line modems go up to 19200 bps. Not bad. Compare that to your average TNC.

>b. Leased data lines

Telco will sell you a DS3 circuit at 44.7 Mbps. Over glass, of course. Copper typically goes to 1.544 Mbps (US) or 2.048 Mbps (Europe).

>c. RF (mainly microwave)

Northern Telecom has announced a radio (using 512QAM modulation, not simple stuff) running at 4 or 11 GHz with a bit rate of about 310 Mbps. I think the channel bandwidth is about 70 MHz, maybe smaller. Compare that to your average TNC! With 16PSK, though, 3 bits/Hz is common.

>Is anyone doing some experiments out there digitizing voice and then
>transferring it at high speeds via RF ???

RF is inherently an analog medium; digital radio is quite practical but tends to cost a bit to get started in, plus eats fair dinkum bandwidth. The telcos use quite a bit of it. Digital cellular radio is also coming; hams are as usual on the trailing edge of the technology. (But hey, we make great keyers!)

It's probably not legal for hams here in Gringonia, since the ARRL went ape-chara a decade or so ago when the FCC said they'd rather regulate

bandwidth than emission types. The ARRL said, basically, "SPARK FOREVER"
and so you can't just run any narrow mode on the ham bands here in W/K/N
land if you want to stay legal.

You know, I've heard my mother gripe about the same thing! Seems that W3WKD had better things to do (like raising 2 kids) than increase her code speed. She holds the Advanced class, but feels cheated!

She still maintains that her "Class A" license was the tops and that she finished the test 1/2 hour ahead of W3WJK,(her husband, my dad) who got the alphabetically-early call due to the "first-in/last-out" phenomenon of stacking your test in the examiner's in-basket!

She also likes to complain that she had to draw the circuits on the test NOT just pick multiple choice.

Yea, I'm not sure what gripes her more: Insentive licensing or my Dad's call. ;-)

>newsgroup is to discuss, the name should be rec.arts.tv.community or
>something specific like that. (I thought of suggesting "rec.arts.tv.commun"
>but figured that would be interpreted as "communist tv"... :-)
>

Well I suggested a while ago the idead of 'rec.tv.cable' and it seems that there is a great deal of ambiguity as to what would be infered from the various group names. Instead of arguing about the name being used for cable TV or communinty access TV, why not have the following:

1) 'rec.tv.cable' : a discussion group for cable tv
2) 'rec.tv.community-access' : a discussion group for community access tv

This seems a pretty common sense solution to both parties - those that think the original group name should be for cable tv, and those that thought it should be for community access tv. Two groups for two different interests.

What does everybody else think?!

Chris

I will be visiting the Boston area between 3/31 and 4/8/90, and would like any information on where to go/what to do/who(m) to see while there. I'll have my Kenwood TH-75 with me, so any good info concerning repeaters to monitor would be appreciated. I don't know anybody in that part of the country, and I'm certain I'll find the same friendly people I find here, on the Amateur bands.

Looking forward to meeting some of y'all (that's Texican for "youse guys").

A good place to start is the ARRL (American Radio Relay League). I don't have the address handy but their phone # in Connecticut is (203) 666-1541. Tell them that you're interested in Ham radio and where you're located and they should be able to help you from there. Another place for books, etc. is the local Radio Shack. They don't always have info but they may be able to point you to some local hams. Good Luck

Yea, me too. Spoils your whole day!

When I was a kid, a neighbor came over and started screaming at my mom
about how my dad was tearing up his TV reception. She tried to explain
that my dad wasn't even home, but he wouldn't listen. He just kept
screaming -- until dad pulled into the driveway! One embarrased
neighbor! Turns out that his other neighbor was fixing up the basement
with a powersaw.

Well, if you were not on HF last weekend, you really missed out!

As 'usual' (or at least, as 'usual' as I can make things be), I was on at the 'usual' time trying to do the un-net. Well, let me tell you, when I heard DZ's and ML's and all that good stuff calling CQ, I'm afraid I never got around to calling cq for the unnet, my apologies (I even heard one 'rare DX' person calling CQ and NOT GETTING ANSWERED!!!!! Too bad he could not copy me when I replied - he could tell I was there and that was it...)

Anyway, I logged 2 German stations, and one Lithuanian on 10 meters last saturday! My first European station!!!!

Anyway, if you've got an HF rig, and you weren't on last Saturday, well, you really missed out.

(All this with about 100 watts into a 5/8 wave groundplane mounted about 30 feet off the ground! ON SSB!)

(Editors note: please excuse my excitement, but I never thought I'd ever work "real dx" until I upgraded and had 'real power', or switched to CW, or a 'real antenna', or .....)

(Claimer: editor == me) :-)

Which reminds me - I had an email message a while back which said that I should not work HF SSB because it would ruin my upgrading. Not so! Making contacts on HF only makes me fear the time when 10m becomes a local-only band... No way do I want to be a Tech when the sunspots change! This is too much fun!

What a coincidence that this subject is being kicked around just now! I'm planning to do something similar around here. I plan on putting an ATV transmitter on a local tall building (I live VERY close to the beach) so that I can watch the ships go by :-). I'm also planning on using 427.25 as the video carrier so that I can receive these pictures on channel 58 on my cable ready TV (and VCR) without the need for a converter. Right now I plan on trying out the KPA5-E 1 watt transmitter. This should give me reasonable picture quality without QRM'ing anyone else. I also want to have an onboard touch tone (tm) decoder so that I can turn the xmitter on/off, pan left/right/up/down, zoom in/out, etc. If you're interested in where I live (to see if you can receive this) look at my ICBM coordinates in my .sig - they're correct. If there's any local interest from the local hams, I may try and boost the transmitter power so that others could receive it. Any help from experienced ATV'ers is more than welcome - so are suggestions from the peanut gallery.

After the inevitable German (re-) unification, what will happen to German Amateur radio?

I am curious about how callsigns will be handled? Will amateurs in the GDR want FRG callsigns to hide that they are in the East? Will they want to keep their GDR callsigns? What about new callsigns; how will they be allocated?

How will the licensing structures be affected? (What exactly are the licensing structures currently?) Will an entirely new licensing structure be set up, or will the existing structures somehow be merged?

NEW CALLSIGN SERIES FOR BRITISH HAMS
(Extracted from March 1990 Radio Communications)

....
At present all UK callsigns begin with the letter G. However, both the
present Class A (with code) series, G+0+3 letters, and the Class B (no code)
series, G+7+3 letters, are rapidly running out. ("5" will be issued for
Class B when the "7"s have run out.)
The Dept of Trade and Industry (DTI) plan to go to callsigns beginning with
the letter "M" for ALL new licences of both classes when EITHER the present
Class A or Class B series runs out.
In the M series, the number will indicate the UK country, and a letter will
indicate the licence class, ie: 2=England, 3=Scotland,4=Wales,5=GI,6=GD,
7=GJ, 8=Guernsey, 1,9,10=spare.
Calls will be like MA2AAA, which would be MA3AAA if the station moved to
Scotland. The MB prefix will be used for special events, and MC for clubs.
MA and MD-MJ will be Class A, MK-MZ for Class B.
The new Novice versions of the Class A and B licences will use the prefix
"2" instead of "M", ie 2A2AAA or 2K3AAA, etc.
The DTI are proposing to allow certain club stations to send greetings
(third-party) messages. This will be indicated by present G
club prefixes being changed to GX for clubs having this privilege, and
GM to GS, GW to GC, etc. Note that use of the new call is only mandatory
for periods during which greetings messages are being sent.
.... etc ....

Who said that the American callsign scheme is complicated ??????

Howdy!
I have a Sony Air 8 receiver and am wondering if anyone out there

has any information on mods for increased frequency coverage especially on in the 174 and up and in the shortwave areas. There was one time that I was able to tune wwv @ 5 MHz due to an error resulting from a low battery but is there another way that is readily accessable.

Thanking you in Advance

That clinches it, Turgidson == LeMay. From Dr. Strangelove:

General Turgidson:
"If you'll recall, sir, one of the provisions of Plan R provides that once the, uh, go code is received, the normal SSB radios in the aircraft are switched into a special code device which I believe is designated as CRM-114..."

I'm still waiting for a CRM-114 to show up at the Dayton fleamarket. I've seen the B-52s in the Puma Air Museum (Tucson AZ) and the Air Force Museum (Dayton OH) but unfortunately they seem to have been gutted of all their electronics. :-)

As far as LeMay goes, read this quote from p280 in "War and Peace in the Nuclear Age" (ISBN 0-394-56217-8). In all seriousness, it's one of the most chilling things I have ever read.

"In September 1957, LeMay briefed two visiting members of Eisenhower's Gaither Committee: Robert C. Sprague, an electronics manufacturer who had also served on the Killian panel, and Jerome Weisner, who became Kennedy's science adviser and later president of MIT. Sprague noted a wall chart showing the response time of SAC's bombers; it seemed to suggest that none of them would get off the ground by the time Soviet bombers were picked up by the early warning network in Canada. Sprague and Wiesner each recalls LeMay affirming that view but adding: 'I will know from my own intelligence whether or not the Russians are massing their planes...for a massive attack against the United States.' And he said, 'If I come to that conclusion, I'm going to knock the shit out of them before they get off the ground.'"

"'General, that isn't national policy,' Sprague remembers saying. 'You know that.' LeMay, he says, replied, 'No, it's not national policy, but it's my policy.'"

I submit this as further evidence that having passed a code test doesn't necessarily make one more likely to accept government rules and regulations. :-)

Well, I took the liberty of re-posting the entire article since I understand that news articles with very long lines can get truncated. I hope nobody minds!

Anyway, I'll drop in my $.02 worth...

First, to Sylvan: How about posting a summary of what you have gotten so far?

I wonder about having a 'negative multiplier' for the more power you run, or other factors which increase your ability to make contacts? Not something which will totally negate the improvements, but which will at least level out the playing field a bit! Either that or limit total power to 200 watts. Why put novices and techs at a disadvantage? (Is that part of the reason for the 'novice roundup' contest (is that the name?), to give novices and techs someone to talk to?) That way, skill will play a little bigger part.

I don't suppose 'official observers' (:-) would work as a means of watching for those who do not id? How about allowing people involved to send in a list of those who were not obeying the rules (whatever they may be), and then using some kind of filter (minimum number of complaints, whatever) to weed out the false reports?

Well, enough stream-of-consciousness rambling for now, lets have somebody who knows what they are talking about post something USEFUL!!!!!   :-)

Phil Karn asks "how come the hams who rise to prominent national positions always seem to be right wing extremists?"

Maybe all those folk in the middle prefer them to left-wing extremists :)

General LeMay put together the most awesome air strike force ever known. For more than 40 years this force, the Strategic Air Command, has managed to conduct thousands of operations involving nuclear weapons without ONCE ever having a serious mishap. Under LeMay's guidance, the most knowledgeable highly disciplined, and competent military force ever assembled has been THE most effective deterrent to global warefare. The B36 bomber was the first global bomber. Its very existence provided the psychological reason to think twice about any subsequent (to Pearl Harbor) attack on the U.S. When the B36 became to low and slow, there followed the B47 and B52. The B58, first supersonic hi-altitude bomber was "un-defendable" during its day and so, also, was an effective deterrent.

Except for the B52, which was used in the Viet Nam war, NONE of these ever fired (excuse me) dropped a weapon in anger. I believe that this stands in obvious testimony of his dream (yes, "right wing extremists" have dreams of peace too). It is no accident that the sign (humorously portrayed in Dr. Strangelove) "PEACE IS OUR PROFESSION" stands proudly at the entrance to every SAC base.   Class dismissed........

Subj: Laser Diodes

Thanks to Dave for his reply. I've gotten a little more info. since my posting. There are several places to buy the visible laser diodes, but everyones prices are HIGH! The cheapest i've seen is $113.00! The following is a list of part numbers, manufacturers, etc.

Toshiba TOLD-9200 (price about $165.00)
Toshiba 9201 gain guided (price about $113.00)
Toshiba 9211 index guided (much better diode) price about $131.00

NEC NDL-3200 (i don't have any more info)

Marshal Electronics of Huntsville (205-881-9235) has the 9201 and 9211 in stock at the above prices. I don't know anymore about them except that they have the diodes!

From talking to people and reading, I have gathered that the diode itself needs to be used with some type of collimator to get what we think of as a beam of laser light. There are several companies that offer an entire assembly with battery pack, etc. for $300-$500. If anyone is interested in this, drop me some e-mail. These diodes look to be interesting and useful, but i'll wait until the price drops. Most all of them operate in the 670 nm range, but that is dropping towards the 620 range (where the standard HeNe laser operates, i think).

> The June 12, 1989 issue of _New_Yorker_ began a series called "Annals of Radiation", the first subtitled "The Hazards of Electromagnetic Fields".

The New Yorker published a serialized version of the book. In other words, these are the same material by the same author, Paul Brodeur.

> The _New_Yorker_ is obviously not a prime scientific source, and I would like to see a rebuttal or follow-up (perhaps in the later issues?... haven't seen them).

There was a "rebuttal" in Forbes in about August or September. It wasn't worth reading - it was just a flame.

> Anyway, read them if you get the chance.

I agree that it's well worth reading. It's easy to either believe it and get scared, or dismiss it as paranoid. It's much harder (but more valuable) to read it analytically and discover what your own prejudices are. I don't know of any other books on this material; one could check out Brodeur's bibliography if one were sufficiently motivated.

I believe Brodeur also wrote the article in the New Yorker a few years ago on the relationship between low-level microwave exposure and cataracts. Again, the emphasis was on the "Oh, that can't possibly happen" attitude of organizations like the Air Force.

A quick comment:
I strongly suggest starting out learning the code at 20+ wpm. It is so much easier to go from 0 up, then to improve late (IMHO). Remember, that you can always test multiple times throughout your learning getting 5, or 13 along the way. I find the learning process is a part of the problem, so keep going while you're psyched up to learn. That applies to theory as well. Go for an extra whether you need it or not, it's easier to do it while you're studying anyway.

Ok, I give up. I'll cry uncle. I've been totally unable to get packet radio to stay up long enough from my QTH to gather in an article which I could really use. I promised the Novice class that meets each Wednesday evening (today is Tuesday) that I'd bring in the VE schedule for New England to the next class, so that they will know who to contact if they wish to upgrade from Novice....

That was two weeks ago when I made the promise. Since then, I've been trying to get onto packet and get the list....I even know the article number on the Bulletin Board WA1PHY (out of Bedford, Mass.): it's 5224. BUT, my rig seems to be totally unreliable. While I can connect to it (via a digipeater in Fitchburg, Mass.), I can sometimes get the banner, and I can sometimes see SOME of the mail that is sitting there for me to read (I know there are at least four packet mail for me.....but I can't read them....), I never get the prompt. It always times out before then.

Meanwhile, I still need the VE Schedule for New England (ie, Central Mass and Southern New Hampshire). Is there some kind soul out there who can get this data off the packet radio and email it to me instead? (At least email is reliable..........:-(

Thanks in advance.

Frustrated packet user (ps, I can successfully connect and receive CAP packets in Wakefield....why can't I receive HAM packets in Bedford????????)

>fleamarket. I've seen the B-52s in the Puma Air Museum (Tucson
>AZ) and the Air Force Museum (Dayton OH) but unfortunately they
>seem to have been gutted of all their electronics. :-)

You'll have to beat me to it!! A friend who was in the USAF says it's a real device, and the control head (shown in the movie) is not classified. They have been seen on the surplus market, and Dayton is probably a good place to look, what with Wright-Patterson AFB nearby. CRM-114 isn't its real name; the CRM prefix would mean "air-transportable radio maintenance." A "CRM-114" label appears among the equipment in the first scene of _Back to the Future_. I named the LORAN-C receiver in my car "CRM-114" and one of its waypoints is FGD135.

Maj. King Kong:
"To insure that the enemy cannot monitor voice transmission or plant false transmission, the CRM-114 is to be switched into all receiver circuits. The emergency base code prefix is to be set on the dials of the CRM. This'll block any transmission other than those preceded by a code prefix. Stand by to set code prefix... Set code prefix... Lock code prefix... Test auto-destruct circuit... Switch all receivers to CRM discriminator...."

Sometimes I recite that while taxiing out to the runway in a mighty Cessna 172 and setting the transponder. :^)

A colleague of mine is interested in finding out about litz wire- past and present manufacturers, performance data (specifically attenuation versus frequency, eg from skin effect in an antenna application), and from whom any might be available today.

I gather that Litz wire is a bundle of finely stranded wires with each strand insulated from the others, thus having lower losses at very high frequencies than solid wire with the same cross section, assuming the skin depth is smaller than the radius of the wire.

I understand that this stuff was often used in low-loss inductors and the circularly-wound indoor antennas found on early BC-band radio receivers. It seems to be hard to find mention of it these days, though, although the laws of physics haven't changed in 50 years and whatever advantages it had then should still apply. Perhaps the nuisance value of soldering all those little strands together was the problem; I don't know.

Anyway, if you have a current source for the stuff, I'd appreciate hearing from you!   -- N8JUF   beale@sierra.stanford.edu --

Re: This OM needs help !

This guy might be one of those people who simply cannot learn code. I've seen it before.

While I'm not a VE, the guys I've taken tests from wouldn't mind the verbatim dot-dash copy and translation. I suggest that the OM write it down like this: |...| This takes less horizontal space on the paper, so less time is spent on the carraige-return. Also, if the OM understands binary trees, that is a good way to memorize Morse Code. In this scheme, 0=dit, 1=dah. Make up a balanced btree, assigning dits and dahs, then create a silly saying to remember the tree.

```
         E                  T
     I        A        N         M
   S        U      R         W     D       K        G      O
  H  V     F *    L  *      P J   B X     C Y      Z Q    * *
```

Something like "Extra Terrestrials In A New Mexico Sun Use Running Water (for) DrinKinG Or HaVing Fun."

You get the idea. Good luck to your friend, and condolences to the family. :-)

The current ARRL DXCC country list follows. Changes from the previous posting (2/89) include the addition of several new countries (T33, ZS9, 3D2 (Conway)), prefix changes (KC6 -> V6, KX6 -> V7, UA1 -> 4K2, UP -> LY, UQ -> YL, UR -> ES, ZS2 -> ZS8, 3D6 -> 3DA) and other minor modifications.

Much of the information was provided by Ron McConnell, W2IOL.

The colon-separated fields are:

1. primary amateur prefix ("*" suffix for deleted countries)
2. country name
3. continent
4. ITU zone(s)
5. CQ zone(s)
6. time zone (hours from UTC)
7. latitude
8. longitude
9. ITU prefix allocation(s) ("~" suffix for unofficial)
10. other amateur prefixes

Please mail corrections and suggestions to me.

We traded messages earlier on HAMLICEN about type-acceptance and the Canadian plan. If I understand the latter correctly, it does not require type-acceptance, just commercial manufacture. That's not radically different from the present de facto situation. The Canadian plan just makes it de jure. And "commercial manufacture" could be extrapolated to include kits.

Hello folks,

I would be interested to hearing from anyone who has purchased one of the below radios. Please EMAIL comments to me and I will post a summary of all comments.

I would like to limit the HF transcievers to the very high end of each company:

ICOM   IC-765
ICOM   IC-781
Kenwood TS-950SD
Kenwood TS-940
Yeasu FT-1000 & /D
Yeasu FT-767GX

Thanks in advance....

DE KJ6NN
Phil

>>> Re unable to find SIMTEL20s pd1 disk

The procedure I use (and it works :-) is:

```
ftp 26.2.0.74              - connect to SIMTEL20

user anonymous             - Now inside FTP
yourname                   - in reply to the password prompt

dir                        - (or ls) this will show you the files
                              at the top level.

cd pd1:<msdos.hamradio>    - change to the HAMRADIO directory on pd1

dir                        - see what's there
                           - there's a file called 00-index.txt
                             which is an ascii file of one line descriptions

get 00-index.txt           - ignore the semicolons and the numbers after
                             the filenames (probably version numbers)
                             THIS IS AN ASCII transfer (default mode),
                             OK 'cause it's text

tenex                      - Tell simtel to transfer BINARY files
                             DON'T use the BINARY command - it appears to work
                             but a 128K file expanded to 178K.  Use binary
                             when transferring from UNIX/VMS machines.

get sm309.arc              - get SUPERMORSE - it's an ARC file, must be in
                             TENEX mode.

get xxx.arc                - the mode stays in TENEX until you give the ASCII
                             command.

quit                       - close connection & exit ftp
```

If the your path is a bit slow, type HASH before doing any GETs, it will print a # after each 1000 or so character, just to let you know how it's going.

As I remember, there's some intro documentation at the top level.

Hope this helps,

Giovanni ZL2BOI

My response was directed at someone who posted an idea to actually have a lower class of "ham" using type-accepted equipment. They actually used the terrible phrase "type-accepted".

Does anyone have the address of Wyman Research. They are the manufacturers of amateur television exciters. While you are looking though your files, think of any comments that you might have on their products. Any response would be greatly appreciated.

Yesterday WWV (and presumably) WWVH began broadcasting reports on the status of the Global Positioning System. The WWV broadcast is at 14 minutes past the hour and is repeated during the following minute. The Omega navigation system status report continues to be broadcast at 16 minutes past the hour. Although I have not heard it yet, I imagine that the GPS report on WWVH is given at 45 and 46 minutes past the hour just before the Omega report at 47 minutes past. Can someone confirm this?

By the way, WWV was predicting a major geomagnetic storm for today. Anyone notice any effects on SW?

I got mine from a place in Texas... Lets see, 'The best printshop in Texas'?
Anyway, the expression 'He is a ham' definately has two meanings with them :-).

My major reasons for choosing them were: they were pretty fast, and pretty cheap. They had some real nice-looking cards, but my card budget is not where I would like it... In any case, I'm relatively satisfied, except that I felt that the printing was not quite as dark as I had expected. Not bad, but not quite as thick on the printing as I had expected from the samples. (but that may be because of my choice of colors...) Bottom line - cheap, pretty fast delivery, not bad quality. If thats what you are looking for, you might want to check them out. If I've got the name wrong, and you cannot find a print shop in Texas with a cute name by looking through QST, email me and I'll look it up.

Actually, Litz wire is probably more commonly available now than it was a couple decades back. There has been a LOT of interest in it in audiophile circles. Many of the high-priced interconnects are made with Litz wire, and many audiophile equipment-builders use it for internal wiring of components or modifications to factory gear.

Unfortunately, it doesn't seem to be easily located. I'm sure that's why you posted the query. I just checked 4 of the major electronic-distributor thick catalogs and couldn't find "Litz wire" or ("Litz" listed under the "wire" or "cable" categories) in their indices. I bet these people DO sell the stuff; it just is listed under some other name or terminology.

Somewhere around the house I have a catalog with a batch of samples of Litz wire from some vendor; if I find it I will post the source. I suggest you post a copy of your inquiry on the USENET "audio" group, if you have USENET access, or mail a query to "info-high-audio@csd4.csd.uwm.edu" (the high-end audio mailing list); there are audio-gear builders there who might have info on current Litz wire sources at their fingertips.

1. Anyone know a MOD for expanding the Kenwood TH-75 Dual-Band Handy beyond 455 Mhz ?? Presently the MOD I made on it allows me Tx Rx from about 395 Mhz. I'd rather have the High UHF range.

2. I had an Icom 3210A but sold it because it couldn't do cross-band repeating with an offset. I'd appreciate feedback from readers as to what they suggest. Seems like the price of two separate xcvrs isn't too far off what some of they "Dual-Banders" are going for.

Feedback is welcomed and appreciated

This is off the original subject by far, but the above caught my eye.
Does the average person these days *have* 2 photo IDs?
                                          -
```

I guess all drivers licenses these days have photos; at least mine does (Missouri). But the only other photo ID I have is my workplace badge. That's because it is a military organization. I know many of my friends who work in other fields, such as teachers and assorted private industry jobs, have no such badges issued to them. Do most school/college ID cards now have photos? (They didn't when I went to school in the '60's.)

I'm guessing many non-drivers may not have *any* photo ID. I guess you
can always go to one of those outfits that sells photo-ID cards, but
they are of course worthless as real ID.

Does this requirement cause any problems? Anybody else out there have
comments on the issue of photo-ID?

I don't have the sked for all NE but

Exams for all class of Amateur License are given every month at MIT in
Cambridge MA.

They are given on the Wednesday evening before the last Wed. of every
month at 7:30 PM in Room 1-150. Walk ins are acepted as long as room is
available.
Bring a photo copy of your present license if any, 2 forms of photo ID,
$4.95 in cash, and a completed form 610 (available from the FCC in
Quency MA) For more info contact Nick at 617 253 3776.

MIT's entrance is located at 77 Mass Ave and posters should lead the way to room 1-150. Ample free parking is available in the evenings.

I am looking to set up a data link, probably full duplex, between a high altitude ultra long duration atmospheric research aircraft and a ground station.

On the order of 4800 bits per second of data is to be transfered. Both telemetry and control is being communicated so the transfer must be real time. (well almost)

Over most of the proposed flight paths any number of synchronous comm sats would be visible to both aircraft and the ground control.

** What is the availability of low bandwidth transponder channnels, who rents them out, how much do they cost?

** Who makes the "ground" stations? Light weight and an omni directional nontracking antenna for the aircraft would be a big plus.

** What are the coverage areas of the satellite receivers? Are their footprints only aimed at land areas?

Thanks in advance.

I recently posted a request for information about the effects of ELF electromagnetic fields on health. This was triggered by a cancer cluster in Santa Barbara, CA and Paul Brodeur's book "Currents of Death." I got surprisingly few responses, but they were quite useful, so I thought I would post them for the net.

First, a summary. Currents of Death is a very sensational book by Paul Brodeur which alleges serious health effects from low frequency, low level electromagnetic fields, such as caused by power distribution or CRT sweep circuitry. I was basically very skeptical because of the tone of the book, and the difficulty of explaining biological effects of signals that are way below the thermal noise level in tissue.

One poster referred me to a book review in the April, '90 Scientific American. This review (4 pages long) gives a very good introduction to the controversy. It also refers to an OTA document (which I plan to order) for more information. The gist of the review is that the book does a disservice due to its sensationalism, but that there is enough evidence of biological effects that more research and some prudent concern is warranted.

I also received a call from Abraham Liboff, one of the researchers mentioned in the book. He said that he and others have done a lot of research which shows biological effects of ELF (extremely low frequency) magnetic fields. His research is in the area of ion transport. He has seen "profound effects" in some experiments. He said that there is as yet no good theory as to the mechanism of the effects - a "delicious scientific problem" is how he termed it. Basically the problem is that the effects of the low level magnetic fields are very small compared to thermal effects (kT noise) and thus its hard to come up with a mechanism that will allow the magnetic field to have a net effect. He did mention another researcher (sorry, didn't write down the name) who has done stochastic modelling under those conditions that did show some net effect. He also stated that he felt that higher frequency signals would probably not cause problems (due to their great attenuation when penetrating the body), and that small electric fields would have no effect. This is not surprising, since the body is a pretty good conductor, making it hard for these fields to be concentrated to a high gradient, and cells naturally have very high gradient fields across the membrane. One exception to this is high frequency fields amplitude modulated at an ELF frequency. My thanks to Dr. Liboff for his concern and his time.

It's interesting to note that Brodeur also wrote "The Microwaving of America", which was a scare book of the seventies claiming that low level microwaves were causing a big problem.

>always seem to be right wing extremists?"

>Maybe all those folk in the middle prefer them to left-wing extremists :)

Right! When I get up there, I'll be sure to remember y'all :-).

>General LeMay put together the most awesome air strike force ever known.
>For more than 40 years this force, the Strategic Air Command, has managed
>to conduct thousands of operations involving nuclear weapons without ONCE
>ever having a serious mishap. Under LeMay's guidance, the most knowledgeable
>highly disciplined, and competent military force ever assembled has been
>THE most effective deterrent to global warefare. The B36 bomber was the
>first global bomber. Its very existence provided the psychological reason
>to think twice about any subsequent (to Pearl Harbor) attack on the U.S.
>When the B36 became to low and slow, there followed the B47 and B52. The
>B58, first supersonic hi-altitude bomber was "un-defendable" during its day
>and so, also, was an effective deterrent.

Thanks! You said it more eloquently than I ever could. Unfortunately, you did leave out the incident where they dropped a couple of unarmed (obviously)

H-bombs either on Spain or just off the coast back in the late 60's (details escape me at the moment, please don't flame). To this day, that's one of the big reasons the Spanish don't like our bases there.

>Except for the B52, which was used in the Viet Nam war, NONE of these ever
>fired (excuse me) dropped a weapon in anger. I believe that this stands
>in obvious testimony of his dream (yes, "right wing extremists" have dreams
>of peace too). It is no accident that the sign (humorously portrayed in
>Dr. Strangelove) "PEACE IS OUR PROFESSION" stands proudly at the entrance
>to every SAC base. Class dismissed........

>Dube Todd N5PDK

We sometimes used the "Peace is our Profession" motto on the Griffiss AFB (416 BMW (H) (SAC)) club repeater (WA2ZXS) whenever we'd manually ID the thing (e.g., one of the club members would grab the local mike of the repeater and blurt it out, usually during club meetings).

See, I knew I could get this post around to ham radio eventually :-).

ARRL FILE FORMAT FOR CONTEST LOG SUBMISSIONS

Rich Assarabowski K1CC
Chairman, ARRL Contest Advisory Committee

The ARRL Contest Advisory Committee has adopted a set of guidelines for submitting log entries on diskette. A suggested ASCII file format was initially proposed by the CAC and the ARRL Contest Branch at the beginning of this year. It was distributed within the CAC and among contest software developers for comment. Considerable discussion took place regarding the merits of binary vs. ASCII files, with software developers tending to support binary file formats. The feeling of the CAC was that although binary files are indeed more efficient, they would be more difficult to generate for the average user. This would tend to discourage rather than encourage submissions on diskette. An ASCII file format was therefore adopted for submitting logs in diskette in lieu of paper logs. Since the ARRL Contest Branch uses binary file formats in its log processing software, it will convert the submitted ASCII files into its own binary format. However, the Contest Branch has agreed to work with any software developer who wishes to generate a binary output which could be directly read in by the ARRL log checking software. Several software developers (K1EA, KY1H and K8CC) have already agreed to produce an ARRL binary format option within their programs and will be providing this option in future releases of their software. Contest logs can be submitted in ARRL binary format from those developers who provide this option. Software developers can contact the ARRL Contest Branch for details.

The ARRL Contest Branch for some time now has been working on a set of computer programs for contest log processing. The objective of this effort is to improve the log checking capability and the accuracy of results, and at the same time to reduce the time involved in processing, scoring and verifying submitted logs, both paper and disk-based. It must be strongly emphasized that paper logs will be scrutinized at least as carefully as computer-generated logs (if not more so!). Log submissions not adhering to these guidelines will still be accepted (such as logs duped post-contest without any time, band or exchange information), however, they must be accompanied by a paper log containing the required QSO data.

The guidelines below were revised a number of times and are the result of considerable thought and discussion. We originally developed a fixed-field ASCII file format with very strict requirements regarding data sequence, justification and field definitions. However, we subsequently relaxed these requirements, in order to make it simpler and less error-prone, without too much additional effort on the part of the Contest Branch. Any contest logging program should be able to produce an ASCII output following these guidelines without much difficulty. Almost all commercial database and spreadsheet software provides an ASCII output file option.

We have initially decided to limit the log submissions to IBM PC or compatible (MS-DOS) disks. If there is enough demand in the future for other computers (Commodore, Apple, etc.), the ARRL Contest Branch will consider accepting those as well. It is also possible to submit logs to the ARRL Contest Branch via modem, preferably for smaller logs and for those who cannot create an MS-DOS disk. The ARRL bulletin board is available 24 hours and is currently on line. The telephone number is (203) 665-0090, using 300, 1200 or 2400 baud (No parity, 8 bits, 1 stop bit). Please follow the same file format as for disk submissions, and be sure to send in your paper summary sheet via the mail.

Finally, the CQ Contest Committee has agreed to accept the ARRL ASCII format as a standard as well, and will encourage submissions in that format. Other formats will be accepted but must be accompanied by a paper log. The ARRL Contest Branch will be working with the CQ Committee in maintaining a unique call sign database and in sharing their log checking methodologies.

SUGGESTED STANDARD FILE FORMAT FOR SUBMISSION OF ARRL CONTEST LOG DATA

1. All files must be in standard ASCII format.

2. All files must be on an MS-DOS formatted disk, 3.5 inch (720K or 1.44 MB) or 5 1/4" (360K or 1.2 MB).

3. A diskette label should clearly indicate the call used, contest name, entry class and date of the contest.

4. The log file must consist of one line of data per QSO, without headers, footers, page breaks or other non-ASCII characters.

5. All QSO data must appear in each line, aligned by column, and must include the following:

    BAND - Wavelength for HF (10,15,20,...) and frequency for VHF
    MODE - PH, CW, RTTY, etc.
    DATE - In MM/DD/YY or DD/MM/YY format
    TIME - 4-digit UTC (without colons)
    CALL - Call sign of station worked (allow 15 columns)
    SENT - Complete exchange sent
    RECEIVED - Complete exchange received
    MULTS - Indication of multipliers, either a symbol, sequential number of multiplier or section/prefix/zone, etc.
    POINTS - ALL unclaimed QSO's must be "0" points
    STATION - Entries in the multi-operator, two-transmitter (Multi-2) class in the ARRL International DX Contest or any contest in which two different station logs are merged must indicate which transmitter made which QSO's.

6. The log data file name shall consist of the call sign and the extension ".LOG", for example, K1CC.LOG.

7. State abbreviations must be standard US Postal Service two-letter abbreviations, ARRL section abbreviations must be those appearing on the ARRL summary sheet for that particular contest.

8. A paper summary sheet is required of all logs, either an official ARRL summary sheet or a close facsimile with a signed contest participation disclaimer.

8. All diskettes become the property of the ARRL and are not returnable.

Can anyone provide QSL route info for:

TI10E (Costa Rica - 10th district?)
ZK1XC (So. Cooks. The ZK1X... calls are recycled frequently.
I need the current (3/90) addr, not the 1989 addr in
W6GO's list).

Also, can any of you DX mavens tell me whether a 1961 contact with KG1FR (Sondrestormfjord ARC) qualifies for DXCC credit for Greenland? The ARRL's current DXCC country list shows only OX as Greenland. KG1 was used for US forces in Greenland in the 60's.

> can not learn it at 5 wpm! A lot of the trouble is that people just
> don't want to be told you *have* to do something. Just an opinion.

Here is an example of statements which are truthful, but by virtue of their incompleteness, can be misleading.

The statement about people of 7 and 75 learning code is not complete. There is no evidence that this capability is existant in 100% of the population at 7, 75, or anywhere in between. Sure, many people at these extreme ages can and do learn code. It is a safe assumption that many, and quite possibly many more, people in between can and do learn code. No one can truthfully say that everyone can learn code.

The opinion that people don't want to learn what they are told to learn is also not complete. While some may not want to just for that very reason alone, many others do not want to IN CONJUNCTION with the fact that they know that learning code is not going to help them in what they happen to be interested in doing. Some people don't like being told that they have to learn something they know they are not going to use and will do them no good. This does not apply to everyone, because not everyone falls into the category of "will not be using code"; but some people are in this category.

Further, because hams have (and certainly at least in the past this has been MOST hams) wanted everyone to pass a code test to "get in", the "outsiders" who were interested in other things looked upon the hams, and the amateur radio service itself, as having an "attitude problem". Probably everyone has an attitude "problem", but some of us are just not making much of an effort to get along with those who have a DIFFERENT attitude problem.

From my understanding, the Canadian restructuring does not involve any no-code HF license class. Unless and until such a thing is proposed, you should not have too much to worry about. In fact, something very close to the Canadian system is being discussed by some as a possible structure for the United States (it even has the correct number of classes for the FCC computer system).

In article <9003192059.AA25965@ti.com> dube@cpdvax.csc.ti.com (DUBE TODD) writes:
>General LeMay put together the most awesome air strike force ever known.
>For more than 40 years this force, the Strategic Air Command, has managed
>to conduct thousands of operations involving nuclear weapons without ONCE
>ever having a serious mishap.

Uh, I wouldn't be so definite. In the back of the fascinating book "US Nuclear Weapons" by Chuck Hansen (1988, Orion Books, ISBN 0-517-56740-7) is a list of "Broken Arrow" incidents (accidents involving nuclear weapons). Hansen described 32 in the period 1950-1980. Most of the accidents involved aircraft, including the famous incident off the coast of Spain in 1966 when a B-52 carrying four MK28RI bombs (with rated yields as high as 1.45 megatons each) collided with a tanker during an in-flight refueling operation. The bombs in this particular case were recovered. But if the descriptions of some of the other incidents can be believed, there is more than one nuclear weapon sitting on the ocean floor, waiting to be discovered someday. (Sounds like an idea for a novel...)

The author added a footnote explaining that other, additional accidents still remain classified. One can only wonder what THEY involved.

I can highly recommend this book to anyone with an interest in the history of nuclear weapons. It's not a literary epic like Rhodes' "The Making of the Atomic Bomb", but he picks up where Rhodes left off (the development of thermonuclear weapons). The book contains a LOT of technical details, including those the government tried to keep a magazine from publishing in 1979.

By the way (just to relate this somehow to ham radio) if you are going to Dayton this year, consider going a day early and spending a day at the US Air Force Museum at Wright Patterson Air Force Base. Scattered among the many airplanes are quite a few nuclear weapons (okay, weapon *cases*) including Little Boy and Fat Man. Somehow, seeing them "in the flesh" made the arms race and the potential of nuclear war suddenly seem a lot less abstract to me.

When ham radio began, CW is ALL THERE WAS. It made some sense then to require proficiency in CW to "get on the air".
CW, now, is just a novely mode - with the exception of truly week signal communications. Therefore there is no reason why proficiency in CW should be a requirement to obtain a ham license; considering that many people never use it again, and it is just an unwarranted stumbling block to many technically inclined persons who could and would "advance the state of the art" in the many other areas of radio communications - Frequency compaction, Microwaves, Software.. etc. These things didn't even exist when ham radio began. We are losing the benefit of their contributions by maintaining an archaic, hand-eye coordination skill, as a requirement for gaining access to a, now, multi-faceted technical hobby. Computers and bulletin boards are where all the modern day potential hams practice a hobby, now.

I maintain that to use the airwaves, and gain access to this great hobby, there should be only a few requirements. The individual should be aware of the rules and frequency allocations. They should have enough technical knowledge to properly operate their equipment and be able to solve interference problems if they arise. Maybe a sound introduction to curteous operation would also be in order - and that's it.

Let's open up the hobby so more people can take advantage of the opportunities and by so doing, increase the strength of amateur radio and increase public technical knowledge.

Yes, that's the stuff. In fact the losses due to skin effect resistance will be lower than for solid wire even if the skin depth is not smaller than the wire radius., although the benefit might be diminished in the extreme case. (operating frequency --> DC)

> I understand that this stuff was often used in low-loss inductors and the circularly-wound indoor antennas found on early BC-band radio receivers.

Well, it is still very popular in switching power supply design, where high currents and high frequency (10s and 100s of kHz) exist together. Litz wire is used in the windings of transformers and chokes where long pieces of wire are needed to carry high current with low resistive losses. Another technique commonly used is to wind a winding with thin copper strap. This, like litz wire, has a high surface area-to-volume ratio, and also has the benefit of a self-inductance which is lower than litz wire.

> It seems to be hard to find mention of it these days, though, although the laws of physics haven't changed in 50 years and whatever advantages it had then should still apply. Perhaps the nuisance value of soldering all those little strands together was the problem; I don't know.

It's actually very easy to solder: one dips the end into a solder pot which melts away the insulation and tins the wire simultaneously.

>
> Anyway, if you have a current source for the stuff, I'd appreciate hearing from you!   -- N8JUF   beale@sierra.stanford.edu --

I have a list of half a dozen manufacturers if that's what you're looking for...email me if you'd like it.

Namibia's independence is being celebrated on the air at the moment. Listen for V51NAM (Victory 51 NAMibia) and give them a call to help celebrate. I've heard them on 10 and 20 ssb - in fact there were 2 or 3 stations on 20m at the same time with this call. I don't have the QSL route, but they were asking that you get the op's name and put it on your card so that they can figure out which station you worked. (Namibia used to be ZS3, and was counted separately from ZS1 et al for DXCC purposes, so the main change for DXers is the new prefix, if you are into such things).

Spread spectrum signals would not be received as a "continuously" sweeping carrier, as the original article mentions. There are two types of spread spectrum -- frequency hopping, ans pseudo-random noise. In frequency hopping, the carrier is "hopped" over many frequencies, not a continuous sweeping. In PN, the bandwidth of the signal is spread and requires special detection circuits -- not something that would be picked up be your everyday SW receiver.

My quess is the continuous sweeping is some sort of OTH backscatter radar.

73's.

Absolutely correct, with the extra note that true Litz wire will have braided strands (as opposed to the simple twisting of normal stranded wire) so that each strand follows the same average path. I believe that this is an attempt to hold down the self-inductance that a simple helical path would give.

I don't have a source handy, although any of the major wire manufacturers probably make it. It IS still in use - look, for example, at the deflection yokes on various very-high-resolution monitors.

I don't know about Litz wire but if you really get desperate, look in the Thomas Register. Any larget library should have it. Call 'em up and ask for a distributor in your area.

Re: Ham Licence Canada (Calgary)

Try looking up Communications Canada in the phone book under Government of Canada.
If there is no office in Calgary, there should be one in Edmonton.

If all else fails - call information and ask for the nearest Communications Canada
office. That should get you started in the right direction.

Good luck and 73's - hope to meet you on the air soon.

HI TO ALL

Can anyone tell me the address for the mag. called "THE SECRECT
C.B.", i known i'm in the ham conf. but Who better to ask about these
types of books. anyway i'm interested in this in knowning the address or
a book store in the toronto area that would care this type of mag.

Thanks
Robert Bonenfant

I recommend getting a Firearm Owner's Identification Card. Here in Illinois it is a photo ID that is very easy to get. You pick up the form at any place that sells guns, get a Photomat picture of yourself and a check for $5 and send it in. They put the picture on the card with the info and laminate the works. Also good for writing checks and they ask for DL and a credit card. I just give them the FOIC instead of letting them write down my credit card numbers all over the place.

The QSL card printer in TEXAS is the Little Printshop. It is in Pflugerville, TX (Just a hair north of Austin). I don't have the address here at work, but can get it for you from home. I've met the guy that runs the place back when I lived in Austin. He's a real nice guy.

I'm visiting Europe this Summer and am going to take my 2M HT with me. I have sent away for reciprocal permits for France, Germany, and Spain, and will also obtain permits in Italy and Austria. I have already received the French permit. My next question concerns operating procedures & rules.

Could anyone familiar with rules and/or customs in any of these countries please send me some basic guidelines and/or differences from the way things are done in KNW land? I'd hate to get my permit pulled simply because I was an ugly American. :-) I speak bueno turisto Spanisho, but can't speak a word of French, German or Italian to save my life. I'm hoping I can use IPA to give my callsign (e.g. Foxtrot slant November Six Quebec Quebec Quebec) and find some English speaking repeaters out and about. I've checked and I can train my rig to do 12.5kHz stepping, but I don't have any tone burst, and I understand PLs aren't used over there.

Thanks in advance for any European operating advice.

```

Richard: I have a TH-75, modified, but it doesn't transmit at 395 MHz. The mod I made was simply to remove the green wire inside the front of the unit. This merely expanded the receive bandwidth on both bands, as well as allowing xmit for the full 420-450 MHz.

Pray tell, good sir, what is the modification you performed? Also, what freq's did it open up to you? (Gosh! I'm just *full* of questions today!) Are you aware of a mod which allows cross-band repeater operation for the TH-75?

        Thanks (as "they" say) in advance,

I don't know anything about this specific proposal, but I am aware that
Southwestern Bell attempted the same thing two or three years ago.
The idea got shot down because it was argued that modem users were receiving
the same quality of service that everyone else was. Therefore, it was
not fair to single them out for additional charges. Appearantly they were
trying to find new sources of revenue to make up for the fact that they were
no longer being subsidised by A.T.&T.

This is a great price for the PRO34. Read on:

I own a PRO34 and am quite happy with it. I believe it is every bit as good as any other scanner in this price range including Bearcat. There are two things that Bearcat has done better than the PRO34. One is that it scans at twice the speed and two, it has a better audio output.

The things I like about the PRO34 that the Bearcat doesn't have:

You don't have to use a battery pack like in the Bearcat. You can use nicads or regular batteries, which means when you need batteries, you can shop around for cheap nicads or cheap alkaline types instead of having to pay Bearcat for an expense battery pack. The nicades I am presently using in my PRO cost me about six dollars total.

I believe there is more information presented on the PRO LCD readout than in the Bearcat.

And I don't believe the Bearcat has two buttons on top for scan and manual like the PRO does. This is real handy for one hand operation and you don't have to fumble for the keys or look at what you are doing to go back and forth from manual to scan.

And finally, I believe the search features on the PRO are superior to the Bearcat. You can do an automatic scan up or down from a programmed frequency. Does the Bearcat have 10 auxillary memories for storing search frequencies like the PRO does?

All in all, they are both great scanners for the money.
Of course I bought my PRO on sale for $229 dollars. And when I don't pay what I think is too high a price for something I simply enjoy it more.

In the latest issue of the "DX Bulletin", which just arrived in my mailbox today (March 22), there is a copy of a letter given to Jim Smith by the PTT in Bhutan. To get right to the heart of the matter, they told him to bring $50,000 for a fee when he came to pick up his A51JS license. As I'm sure many of you know, A51JS is on the air now. This is the first time that A5 has been active since the early 80's. That's great news, but the issue of the $50,000 is not. Since Jim is making an appeal for help in footing the bill, I can only presume he caved in to this outrageous demand.

So now comes the question. Presuming for the moment that you will agree with me that we do not want to encourage third world countries to extort the international amateur community into paying ransom for licenses, we are left with the choice of whether we respond to Jim's request for assistance here. If we do send in contributions, then we have helped Jim to simply pass it along and the next guy looking for a day in the sun will know that cost is not an issue. For that reason, I think a point needs to be made with THIS one that the amateur community simply will not be pressured into paying big bribes. Contributions to DXpeditions which help to defray travel and equipment costs help keep the DX community going. There are plenty of opportunities (e.g. YASME) where we can offer this kind of direct support. That isn't what's going on with A51JS, though.

I don't know much about the material itself, but you can still find it on many transistor radio loop antennas (at least, several transistor radios I've torn apart recently have them).

>   Anyway, if you have a current source for the stuff, I'd appreciate
> hearing from you!

Once source is Amidon Associates, 12033 Otsego St., N. Hollywood CA 91607, who wanted $0.05/ft for 8/42, 8/44 and 10/44 Litz wire as of July '89 (the most recent price list I have).

Don't count on the modem "tax" idea dying (sp?) out. The fact that the TELCOs can fit more than one voice conversation onto a 64 Kbs channel, but can only fit one modem session per channel means that effectively they are "losing" money on modem use. Combine this with the explosive growth in the use of FAXs (modems) and I think you will see the TELCOs developing innovative types of signal recognition to differentiate between high density and low density use of baseband channels.

>

Now that I have received my PRO34 and had chance to use it, let me say the $175 was a great price this piece of equipment. I have done the 800mhz mod to restore full 800mhz coverage. The audio is not a real problem for me as I play it through a home made speaker/descrambler (so I can monitor the local police) that has a built in amp. Your are right that the scan speed needs a bit of help and im hoping soneone out there may know of such a mod. (If so please E-Mail it to me)

Bottom line, im feeling a-ok now that the PRO34 is here!

Please post details of your descrambler circuit? How is the scrambling
done? What does the signal look like in the frequency domain? In the
time domain? How do you descramble it? What circuit do you use? How
does it work? Almost everybody wants to know. Thanks.

This got mentioned a few months ago. This appears to be a dead issue; the FCC canned this idea. (At least according to traffic on the Net several months ago). This rumor surfaces every few months, but I think it can be safely ignored.

I have owned a Bearcat 100XLT for about four years. They are terrific scanners for general purpose monitoring. Mine has traveled with me on storm chases as well as doing daily duty as a police/fire monitor.

The battery life is very good. Mine generally gets 6 hours of continuous usage monitoring high volume channels. I am still using the original battery that was shipped with the unit.

I do have a problem with IM at my location. I don't really blame the scanner for all of it since I am extremely close (less than 1/2 mile straight line) to two of the transmitters. I can't really compare this radio to others since it's the first scanner I have had for any length of time.

Highly recommended.

In "Reference Data For Radio Engineers" (1977, Howard W. Sams), under the heading "Audio Filter Reactors (Coils) it states:

"Audio filter reactors.....are inductances that have the following qualities: (A) High quality factor (Q); and (B) Stable inductance with variations in frequency, operating level, and temperature........(deleted discussion of distributed capacitance)....Rw (representing the copper losses in the winding) is made up of the dc resistance of the wire and the eddy-current losses generated in the winding. This eddy-current loss can be minimized athigh frequencies by dividing the wire into many small wires. This type of wire is called Litz wire." Notice that the term "high frequencies" is used in the AUDIO context, not the overall frequency spectrum.

This book is certainly not the "last word" on the subject, but since I don't see much widespread use of Litz wire in RF coils, my gues is that its advantage over solid wire is minimal (or at least not cost-effective).

There's no mention of the use of this wire anywhere else in the book.

On April 7, 1990, at Worcester Polytechnic Institute in Worcester, Massachusetts, the WPI Wireless Association will be holding The Second Annual Open House in its Ham Shack. It will run from 10:00 AM to 4:00 PM. We will be working on many bands (160m - 10m, 2m, 440MHz, as propagation permits), and in many modes. The Club Station, W1YK, is excellently situated on the roof of Salisbury Laboratories, which is one of the buildings on the top of a large hill where WPI is located.

The WPI Wireless Association, founded in 1909, is the oldest college radio club in the United States. Originally 1YK, the station and club has enjoyed a wide variety of equipment and opportunites, including a 440 MHz repeater and a satellite tranciever station.

Come and help us celebrate our 81st Anniversary!

For more information, send mail to me (see signature), or any of the people you hear working as W1YK.

----------  Anything with this tag on it is purely my own opinion ---------
```

Directions to WPI follow:

From East or West:

Get on to I-90, the Massachusetts Turnpike. Travel until you get to the intersection of I-290 and I-395. This is about 50 minutes West of Boston and 50 minutes East of Springfield, and also one exit East of the I-84 intersection at Sturbridge. Exit and follow the signs for I-290 East to Worcester, Auburn, and Marlborough. This is done by staying completely to the left after the toll plaza.

From the South:

(Connecticut). Get onto I-395 and proceed North. At Auburn and the intersection of I-395 and I-90, the highway you are on will change to be I-290.

From the South, East, West:

Proceed East on I-290 until Exit 17. This is Rte 9, also known as Belmont Street. Exit I-290 and at the light, make a left. Stay in the middle-or-right lane, and proceed straight through the next two lights. You will see the Courthouse on the left and the

Worcester Memorial Auditorium on the right. Proceed up the Hill.

From North:
Get onto I-495 going West or South. Proceed until Exit 24, the intersection with I-290. Get onto I-290 and continue West until Exit 18, which is Rte 9, also known as Belmont Street. This exit is right after two large merges, so you will have to cross 4 lanes of traffic quickly. Exit, and at the light make a right. Follow the road until you intersect with Rte 9, also known as Belmont Street or Highland Street. This is a *big* intersection. Make a Right onto Highland Street and proceed up the hill between the Courthouse and the Auditorium.

From in Worcester:
At the top of the hill is a pair of lights. Proceed through both. about 1/2 mile down the road there is another light, with a Store-24 on the corner. This is West St. Make a right here and proceed. The stopsign marks the edge of WPI. Proceed straight accross, and park in the parking lot to the left at the top of the hill. At the very top of the hill, on the right, on West Street, is Salisbury Laboratories (you can see the antenna arrays for miles). Follow the signs.

I assert there is no concensus on this issue.  If your belief is different
than mine (and I am sure it is) then I am correct in my assertion.

> law, but also) because it removes the usefulness of the CW requirement.
                                        ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
We also certain disagree here.  More on this below.

> If you really learned CW, you could use in on the air.  By using this
> method, you will be incapable of using CW.  This situation is analagous
                      ^^^^^^^^^^^^^^^^^^^^^
What is the purpose of a CW test?  To cause people to be capable of using
CW?  If so, it is not working because I, and a very large number of hams
are presently incapable of learning CW, and we did not even need a clever
method of doing it.  I am sure the vast majority of Technician class hams
cannot operate CW now, and large numbers of even extras cannot.

> to somebody who memorizes the answers to the technical/legal questions,
> without even knowing what the questions were.  Such a person can pass
> the test, but all of the useful technical/legal information is not
> available to them to draw on because they didn't learn it!  I don't
> think any of you no code folks would approve of somebody using this kind
> of method to subvert the useful technical/legal written test(s);
> likewise you shouldn't approve of this method to subvert the useful CW
> requirement.

If we agreed that the CW test was useful, we would not approve of this method.
Many people feel that the CW test serves no useful purpose.  It does not
succeed in any stated purposes, including the one you seem to be stating,
that it is to get people to be able to operate CW.

I personally agree that this method will not result in learning CW properly
to be able to operate it.  But if it helps get a new ham into the hobby and
service that would otherwise have not been able to, and if this guy is one
who will be contributing, such as in areas of packet radio, them I am all
for this method or any other that gets the job (of passing the test) done.

To all those who have no interest in CW, the first thought on their mind is
"why do I have to take this stupid test".  After they realize the test is not
going away the second thought they have on their mind is "how am I going to
pass this test".  Note that they do NOT think "how am I going to learn CW".
A few people just go off in disgust thinking "those stupid hams, all they
want is to pound brass, work DX countries, collect QSL cards and certificate,
and they think that is all there is" when what they were interested in was
experimenting with the technical sides of radio, and these are the people
who could be the INNOVATION back into ham radio that are being scared off
by useless code requirements.

Since it is the case that LEARNING CW serves no useful purpose to those who
have no interest in operating CW, the only logical approach they would have
```

to the "CW test problem" is how to PASS it, get around it, or whatever.

You, sir, seem to be objecting to the fact that people do not have your attitude about CW that it is something worth learning and using. You will just have to accept it as a fact of life that lots of people have NO INTEREST WHATSOEVER IN OPERATING CW for whatever reason (and there are various reasons). If you cannot accept that, then I would have to think of you as one of those people who wants everyone to be all alike, and just like you, of course.

The present theory exams are already not serving their intended purpose. I have spoken with many hams who have an extra class exam and could not design a radio with the ARRL handbook in front of them. Of course, today, not everyone needs to design radios, but not everyone needs to know CW, either.

One needs to know CW in order to operate CW. When the CW test was first being given, all radio operation was CW, so there was a one-to-one relationship between learning to operate CW and learning anything else about radio. Remember, the test back then was a SENDING test. It was not designed to keep out the riff-raff, but rather to keep out anyone who just didn't yet know the code (or the CORRECT code, as the case probably was at the time) As soon as phone came along, the test should have been abandoned at that time, or else used to grant privileges to operate CW. Since few hams operated only phone at that time anyway, there was not that much pressure to delete it.

I have fond memories of the Little Print shop. Back in the days when you waited for six or more weeks to find out whether or not you passed a license exam, and what your call was, the advertising brochure for the Little Print Shop told you the answer to both questions -- quite a few days in advance of the Federal Government getting around to tell you.

Its available from RADIOKIT in Londonderry, NH 603 437-2722. Last time
I was over there I saw an sign on the wall announcing its availability
and since I had never heard of it before inquired about it.

I have no idea about types, pricing etc., but give him a call.

We all know about the Cellular Phone Industry. We all know about the insidious ECPA. This article is related to these topics, but not exactly.

Cellular is NOT the only mobile phone technology, as I am sure you are aware. In many communities, the older 152 mhz band phones still operate. In addition to this band, there is an 800 MHZ cellular smell-alike system called SMR (smurr) which uses EXACTLY the same trunking technology, but on a slightly different band. My community recently (last month) became the recipient of this technology. While scanning the 800 mhz region on my UNMODIFIED PRO-2005, I found several frequencies with a new strange BUZZING digital signal. Within a few days, I started hearing test conversations on other frequencies in the range. I knew it was technicians, and I assumed it was SOME kind of new service, possibly business related. Imagine my surprise when I began to hear telephone conversations, with very clean crisp audio (Much better than the 152 mhz system, which over the years has gotten muddy and distorted)...

Then newspaper and radio ads began appearing for a WONDERFUL NEW telephone system. The name of this wonderful new system is something like "PRIVACY PLUS" a name that makes it sound even more wonderful than cellular.

Soon more and more activity was noted, and our local scanner SIG began discussing the new phone system, made by MOTOROLA. The technology is exactly the same as CELLULAR, just a different band plan. A band plan that is NOT eliminated from ANY scanner on the market. No diodes to clip, the signals are there for the monitoring.

Now it is my understanding that the ECPA forbids monitoring of all such mobile phone calls, except for determining the source of interference. Thus I guess by regularly scanning an authorized portion of spectrum, and being totally unaware of the existance of this service, we became unwilling radio criminals.

Well I decided I wanted to know more about the system, so I called the company selling it. I asked for information, the more technical the better. I received a coverage map and a price list in the mail. Then I received a sales call, where someone offered to bring a unit to my home and demonstrate it. I declined the offer, but said I was interested in the system, and wanted to know more about it. The salesperson knew very little about the technology except to say that it was the same thing as cellular, only "on our own frequencies". I then asked my key question:

"What about privacy? You call your system "Privacy Plus", does this mean it is secure, maybe even better than cellular?

"Oh YES, our system is very secure!"

"But what about shortwave listeners or ham operators, don't they have police scanners or something that would allow them to listen to my conversations?"

"No, this is not possible, you see our tower sends out a signal every ten seconds, and that makes it impossible for anyone to evesdrop on your communication. PRIVACY PLUS is just what the name implies"

I wanted to SHOUT at her that at that very moment, my unmodified scanner was picking up one of the salesmen doing a demo for some other unsuspecting customer. Instead, I just asked to be kept on their mailing list. She said she would call me again in June...

I believe that the sales people are NOT to blame here. They just want to sell the equipment, and they either make assumptions, or their bosses have convinced them that the name PRIVACY PLUS is more than just a silly meaningless trademark.

The same sales tactics are used to market CORDLESS PHONES, that have a PRIVACY button which does nothing but change frequency. Yet everyone I know who has a cordless phone thinks that it is a PHONE.

For those who MONITOR the 46.61-46.97 band, I do not have to tell you that people who use these things have no idea how far their signal travels. I live in a small town, and with a good outside antenna, that band is CONSTANTLY filled with activity, and some of the most AMAZING conversations one could ever hear.

I hear two different interpretations of the ECPA regarding the 46/49 mhz band, and perhaps someone out with more knowledge can set the record straight. In a recent POPCOM, Tom Kneitel said it is illegal to monitor the "Pedestal" (or base unit) portion of the signal, but the 49 mhz part was OK to listen to. I think this is nit picking. Cordless phones have NO license, and they have a nearly hidden notice stating they may not be totally private. I also understand that court cases have upheld the fact that these units have no guarantee of privacy, and people get busted for making drug deals on their cordless phones.

Has anyone read Kneitel's book on Telephone Monitoring?

And is there anything we can do to get these sales people to stop lying to their customers about PRIVACY PLUS and the PRIVACY BUTTON and other deceptive mind balm?

This is posted to rec.ham-radio AND rec.radio.shortwave. SAY YES to rec.radio.scanners, eh?

A year or so ago, I decided I wanted a GREAT scanner antenna. Wide coverage, and the ability to pick up weak signals, since I live in the boonies...

Everyone suggested I get a discone... And after the prices were examined, I thought that $100 or so was a lot to pay for a twinky little antenna with unity gain. Thus I decided to build one. Thanks to USENET I collected all sorts of plans, diagrams, etc. Being lazy, it soon became winter and my plans were put on hibernation.

Now spring begins to rear its head, and my thoughts again began to turn to better signals.

In the meantime, I had done a lot of reading about scanner antennas, and found out that one of the equipment reviewers in one of the magazines uses the MOTOROLA MONITENNA Model #5094 as his STANDARD by which to judge all others. No other antenna has yet beaten it, said the reviewer.

Then I got my BOB GROVE catalogue, and in it, Bob says: "The best Outdoor Scanner Antenna made is the MOTOROLA MONITENNA MODEL #5094" However GROVE does not sell it. They said it is just too big for storage and shipping, but if a person wanted the BEST, they should get THIS one, from a Scanner Dealer or TV shop.

That convinced me that it must be good, and I am forever thankful to Bob Grove Enterprises, even though the only thing I have ever gotten from them is Monitoring Times (One of the best if not THE best SWL/Scanner/monitor magazines of all time)...

Finding a dealer to sell me the antenna was a bit of a challenge, but finally a local CB dealer said he would order it. He got three of them in, and they sure come in a BIG box, which is very OXY to try and get home in a compact car, let me tell you.

There were just one pleasant surprise after another with the antenna though. The first good news was the price. My dealer only wanted $40 for it. I figured there must be a mistake, but that was HIS price (The guy is not out to get rich, and runs his shop more as a hobby). The next surprise was that the antenna requires NO assembly. It opens up like an umbrella. Everything snaps into place. BINGO. The antenna comes with 65 feet of coax already attached, AND a motorola plug soldered in place. (I had to get a convertor to use it with my PRO-2005)...

But the best news of all is that it WORKS. This antenna has GAIN on the most popular scanner bands, and I began to pick up things I had NEVER heard before even with other outdoor antennas.

This antenna does not claim to have the wide flat coverage of a discone, but I am able to hear things very well outside of the bands that it says it covers. EVEN the FM broadcast band was hopping with new stations. The MILITARY air band works great, and I am also able to hear Canadian Commercial aircraft. ALSO I finally heard a transmission on 123.45, the pilot to pilot chat channel. Since we have only one commercial flight a day out of our podunk airport, this one had to be way off in the wild blue... I can now hear a mobile phone tower 60 miles away, and the coast guard from over 100 miles away on channel marine channel 22.

Cordless Phones? HA! They are stacked three and four deep and that band is NEVER quiet.

Would I recommend this antenna? YOU BET YOUR PLL I do... The other two that the store ordered went like hotcakes, and he ordered three more.

There is one of those three left, and it is MINE. My second MOTOROLA MONITENNA Model # 5094 goes up 40 feet SUNDAY....

Talk to your local CB or SCANNER store. Get your local monitoring group in on the deal. Have your CORDLESS PHONE MONITOR SIG order them bulk!

This is one fine antenna....

(I do not work for Motorola, or any other electronics wholesale or retail firm, I am a computer consultant, and the radio hobby is what I do to stay sane)

copied from packet:
PRO-2005 mod

1. Unplug the radio
2. Remove the screws and take off the top cover.
3. Look for D502 on the inside right hand-side of the front panel.
   (No need to unsolder the silver plate protecting the vertical board!)
4. Simply cut the diode and reverse the process.
5. You now have complete cellular band coverage!!

Of course, according to the EPCA law, you are not allowed to listen to
these freqs.
The mod works for me. Proceed at your own risk de KB2BBW.

73 and enjoy!! de K-B-2-Big-Bad-Wolf (Woof! Woof!) @ WA2SNA.NJ

Standard disclaimer: I haven't tried this, proceed at your own
risk. WA2ISE

   Our local police use what is commonly called "PHASE INVERSION" and sounds
   like someone w/marbles in their mouth. Being the bottom of the ladder in
   'secure' communications it can actually be recorded scrambled and later
   descrambled when played back. Anyway - ill have to look and see if the
   design is still laying around here. If I can find it in my piles of papers
   ill post it.

N2HHR (mark hilliard) inquires:

>Is the MFJ product line as bad as he claims?

I just bought an MFJ "econo keyer", a small electronic keyer that sells for just under $50. Has a Curtis chip in it, and the circuitry is identical to the keyer that sits on top of the Bencher iambic paddle. (Incidentally, the keyer that goes on top of the Bencher costs more, and in my taste, is uglier, so I didn't buy it, although I use Bencher.)

This keyer suffers from RF feedback. When I run my rig (an IC-720) at more than 50 watts, "0" becomes "2" (that is, _____ becomes ..___) - a most ingeneous feature, nicely complementing my poor sending skills! I plan to fix it today, by sanding off the paint inside the box, and giving it the same ground potential as the transceiver.

As for other products, I don't have first-hand experience.

I have heard more than one person comment on his experiences with My Friend's Junk. My problems are fixable, so that's okay. If you're looking for a product that will work flawlessly from the moment you buy it, MFJ may not be the right choice. But I don't know for sure. Some people are quite satisfied with what they got. For example, I have heard conflicting reports on the MFJ-1278 multimode TNC. A friend likes it, another person hates it - I'll never buy it. Somebody had an antenna tuner that worked - I'd either build my own, or buy another manufacturer's (like the AEA 300 watt tuner).

Take this BOZOs comments with a grain of salt... This "Gentleman" keeps
IRCs and Cash sent to him when people try to QSL with him. I caught him
on several contests and he has told me twice that he would QSL if I sent him
a card. I did better than this... I sent him my QSL card, 3 IRCs and a
Self address envelope. I have never recieved a card back (this is over 1 year).

I recieved a card from V31DX two days ago after only one month... And this Ham
said he was sorry for taking so long... One month is pretty good!!!!

Now as for the comments about MFJ gear... I have owned a MFJ-1274 for 3 years
and it has never failed me... It has been left on for 24 hours a day for about
the last year.... What a great TNC!

As with any company I am sure that some products are not fantastic...
But I have been very happy with what they sell...

I didn't say anything the first time this subject cropped up a few weeks ago because my experience with MFJ products is limited. But I've been using the same MFJ 901 tuner for six years now to tune my aluminum porch awning, and it's been fine. (When I had the carport hooked up, I had another 901 on it.)

True, I only run 100 watts into them. But anything that can bring an awning's SWR down to 1:1 on everything from 10 to 80m is okey-dokey in my book.

Howdy:

I (FINALLY) got my copy of QEX today (not their fault, I waited until the last possible second to renew just like always) and read McClarnon's (VE3JF) article, "More Ideas for a Robust HF Packet Signal Design". I have just a couple of comments:

HIP HIP HURRAY. HIP HIP HURRAY. Sanity at last. Barry just moved to the top of the list to test DSP modems built by yours truly for HF.

If you want to read a couple of sane articles about HF, I suggest you get a copy of the March 1990, QEX and his earlier article in QEX in December 1987. A relevant article is done by Allan Kaplan, W1AEL, and is a nice thought provoking piece, even though I came to the same conclusions Barry did. You may find Kaplan's article in the November 1989 issue of QEX. It appears that QEX is providing a useful forum for discussion of HF modems/protocols. I will describe my work there in order to fulfill a (two year old) promise to Rinaldo. What Barry describes as his `ideal modem', one which does multiple bits/baud and the baud rate is 75 baud, is exactly what I have done and the first report was given at DATASPACE 1989, last July in Guildford, University of Surrey, England. There were few details and now that I have actual `tnc hardware/software' to hook it to, the testing should proceed at an accelerated pace.

At the moment, I am really busy adding satellite modems, and other `required' modems (Why do I need to add THIRTY different tone pairs for a single HF FSK modem?). I'm also hacking a modified duobinary partial response at 4800 baud (a sane approach to going faster with existing FM radios, No DC and no excess bandwidth), and other goodies (all the usual HF WEFAX, AMTOR etc.)

I hope to see many of you hams at Dayton and to show you all of the wonderful toys during either my packet or satellite talk.

Once again, I recommend Barry's work/papers highly.

sawyer@twg.com (Bruce B. Sawyer) reports:

>>In the latest issue of the "DX Bulletin", which just arrived in my mailbox
>>today (March 22), there is a copy of a letter given to Jim Smith by the
>>PTT in Bhutan.  To get right to the heart of the matter, they told him to
>>bring $50,000 for a fee when he came to pick up his A51JS license.  As I'm
>>sure many of you know, A51JS is on the air now. This is the first time that A5
>>has been active since the early 80's.  That's great news, but the issue of the
>>$50,000 is not.  Since Jim is making an appeal for help in footing the bill, I
```

>>can only presume he caved in to this outrageous demand.

[rest deleted]

Both QRZ-DX and The DX Bulletin say the fee is $5,000 and not 50,000. This is apparently based on the "standard tourist" rate of $200 per day for a 25-day stay. If Jim Smith were touring around, looking at whatever it is that Bhutan has to offer, I suppose it might cost him that much, but since all he's doing is sitting in one place playing with the radio, I guess they decided they should relieve him of this much money for the privilege of doing so.

If things go well, this will work out at a few cents per QSO, and can probably be covered by contributions he receives with the cards people send him. You can argue that even $5000 (or $500 or $5) is too much to pay for the privilege of operating from Bhutan, but it's not quite as bad as 50K.

MFJ, like so many other little companies that today are the source of so much amateur stuff, has its share of problems. But it is generally acceptable stuff. I have half a dozen MFJ 1270s and 1274s, and one 1278 and they have generally worked flawlessly for several years. Our club has several MFJ antenna tuners; these are fine.

The crank on 10? He's a bozo. A lid. Ignore him, turn off the two-way and turn on the broadcast band rig. But mainly ignore him. But so long as rif raft 'round him, he's got a captive audience.

I fully agree with you. Amateur radio is just that amateur radio ... It is done for enjoyment and experimentattion. Paying $50 g's to get a licence for a dx call is not only unreasonable but it is indicative of poor judgement as a ham. If the gentleman feels he needs that kind of attention I say let him pay the bill himself.

Excerpts from the ARRL handout on operating in Mexico
[dated June 1988, approx.]

The United Mexican States has not entered into a reciprocal licensing/operating agreement with the United States (though the two countries share a third-party traffic agreement).

Mexico, however, issues operating permits to U.S. amateurs on a courtesy basis. Upon arrival in Mexico, visit the nearest Delegacion Regional de Concesiones y Permisos de Telecomunicaciones. There are many offices througout the country, and a list of them is available from the ARRL Regulatory Information Branch for a business-size SASE.

You should take the following:

- A written request for a temporary operating permit, which contains information on your equipment, address in Mexico (friend or hotel/motel) and automobile.

- A copy of your tourist card or visa (issued free of charge by the Mexican consulate located in many U.S. cities or by the immigration office in Mexico).

- An HD-1 tax receipt for a license fee (37,000 pesos, or $26, as of September 1987) paid by you at the nearest Office of Secretaria de Hacienda y Credito Publico.

- A copy of your FCC license

[stuff deleted]

Guest operation by foreign amateurs of XE stations is permitted.
[stuff deleted]

Phone patch operation is discouraged except in emergency communications.

The following are editorial comments by KB0CY (based on talking to several US amateurs who hold XE licenses)

* The actual procedures seem to vary, depending on where you are in Mexico.

* The license is good for the same length of time as your tourist card which is usually 6 months. It is not easily renewed -- it requires the same fee & hassle all over again.

* It takes about 1/2 day to obtain the license (if things go well).

* The latest info can be obtained from the ARRL for an SASE.

* Contacting a local amateur or someone who has obtained a license recently is very helpful.

*

Our club station (K2GXT RIT ARC) uses a very nice QSL. We can afford to do this because we use the same QSL as the local Rochester club. They can buy them in quantity, make a few plates to personlize them, and produce many cards in the same printing, saving time and money.

See if yuor local club offers such a service.

I would like to know if Spring and Summer has any effect on reception.
For the past few days, it has been very hot in NJ and the reception on
my Sony-2010 was poor and there was lot of disturbance especially tuning
to All India Radio. However, there was no effect on BBC and other major stations

Can some enlighten me in this regard.

I've been reading some things lately about visible laser diodes. They havn't mentioned any sources for these new little beasts! Has anyone got any ideas where they can be ordered (preferably cheap!)? It looks like they might be a natural for experimental laser communications. Barry, do you have any experience with any of these?

Thanks

Hi,

Depending upon the amount of work you do on 440, the answer is you need to do nothing. Using a 2-meter J-pole on 440 only results in an SWR of 1.8:1 or so! I couldn't believe it either until I verified it. That is about the same as a rubber duck if you were anywhere near a wall or something.

If you operate a lot of 440, you may want to consider something else, but I thought you would be interested in that fact.

73,
Gene

The poster of the basenote is trying to get from 5 to 13. I'm trying to break the 13wpm barrier and get to 20. I ran into a guy on the 80m novice CW band that suggested that I copy in my head by sound, without writing it down.

One of the problems with writing down characters while listening is just that - you can't do two dissimilar things at once. By getting the translation part down, you can buffer words in your head, then write down words link normal people do. The key is to compress the information in your mind as much as possible - concentrating on word sounds, rather than sounding out letters. For example, what sound is easier to remember - "example" or "e"-"x"-"a"-"m"-"p"-"l"-"e" ?

I've tried this approach, and find that I can understand most characters at 20 wpm, but I'm still having trouble buffering the words. The worst words are ones that are not spelled the way they sound.

Randy, Please be very carefull! Some stereo amps can not take the low impedance that a capacitor across the output will present at ultrasonic frequencies. Typically, wide-band response amps "see" a load that is almost a short circuit at higher frequencies. Some amps will shut down due to excessive current in the output. Other amps burn up the output stages because the capacitive load changes the original design parameters used for the amp's internal feedback...the amp go into high frequency oscillations which may not even be heard in the speakers (BTW, this can also burn out the voice coil of tweeters due to excessive high freq. power levels that they were never designed for).

I learned about this little problem first hand when I was a stereo service tech and had to rebuild an amp when the owner put >shielded< wiring to the speakers in an effort to solve an RFI problem. There's lots of capacitance added with this type of wire.

Before you charge ahead, contact the manufacturer of you stereo for their exact recommendations on resolving the RFI problem. Perhaps the signal is not entering through the speaker wiring at all...mayby it's coming directly in through a non-shielding plastic case into the low level circuitry or perhaps its coming in through the line cord.

I have the same problem with my stereo, a buzzing sound when transmitting, which I found could be cured by moving the transmitting antenna further away...a case of fundamental overload.

Good Luck with this problem...it can be very frustrating to resolve.

Don't put too big a cap across your speaker terminals to cure RFI. It might cause instability in the amplifier.

In fact, 330 pF capacitors are series-resonant at about 146 MHz (assuming short leads), so would make an excellent bypass capacitor for the 2 meter band. This should be small enough not to mess up amplifier response.

Bob, you mention the public domain files in comp.sources.misc. How does one get a file from that? Being a new comer, these wonderful hints aren't available without asking many questions to even more people.
Thanks for the help in advance.
Also, is there a file that explains the inner workings of this system in lay men terms?

I have recently aquired a JIL Scanning Monitor, it is marked
HF/VHF/UHF and FCC ID BGL90MSX-400 but has no model number.
It also came with a UHF converter (800-1400 MHz) JIL model RF-8014.

It seems to work and be reasonably easy to operate, but came with
no info. I am looking for at least the operators manual, and
possibly a service manuel. I have had no luck locating the
manufacture are they still in around?

I am particullarly interested in the functions (interface to) of
the rear pannel connectors, the 34 pin remote control, 3 pin AUX
control and the 5 pin REC control.

Does anyone know anything about this beast? Is it worth investing
my time in it? Has anyone done a review?? About how old is it,
and what was it sold for new?

2.4 kbits/second suffices for digitized voice, with appropriate digitizing algorithms.

Well.... I don't know where he tests computers, or what he buys, but FCC level 'B' does not come for free in any +modern+ computer (aka over the last 7 years). If a "CLASS A" computer is tested and acutally exceeds the limits of a "CLASS B" device I do not know a single person in any company that would not list it as a "CLASS B" device. I have tested computers from many companies and getting to Class B is no small task. A class "A" device will in almost all cases be much hotter than a Class "B" device. When we do testing at my company it takes nearly 3 months to get to the point where we can submit to the FCC on almost any product that is class 'B'. Getting to Class 'A' takes one week and no submital is required. That should say something about the work involved.

The person who originally asked for the help had a problem with a Class 'A' device. I would bet that he also had problems with his FM Radio (some freq) and his TV if it used an antenna and not cable.

A Class 'A' device has no place in the home and especially no place in the
ham shack where the ability to hear RF (that rare DX station) is critical.

>
>Even Class B devices may cause annoying interference, if they happen to

>are more likely seeing interference radiated from the system.

All true and shows that even Class 'B' devices are not perfect from a
hams perspective. So why not get the best that you can and avoid most of
the problems.... As a side note, If you see a "VDE level 'B'" sticker
on the product that is better yet since it has been tested to an even
harder standard (this test is harder on conducted emissions and also
checks for Magnetic emissions).

I deleted all of the suggestions to conserve net bandwidth... All
are valid...

Theoretical Bandwidth is 22KHz; 19.2Kb (or 2x9.6Kb) are pretty close.

>b. Leased data lines

Depends on how much money you want to spend. ISDN over simple 4 wire pair
goes about 144Kb. OC3 service will get you 155.52 Mb, but will cost a whole
lot more.

>c. RF (mainly microwave)

Yo, Glen? What are you up to these days? ;-)

Seriously, using cheap stuff, some common data rates are 240.3Kb, 1.544Mb,
10Mb. Define cheap as being under $500 per end.

Yes, buy a 2m 70cm duplexer and put it at the end of your feed line.
This will make your 2 antennas look like one dual bander. The cost for
a good outdoor duplexer from larson is about $60.00. Good luck.

I can't help you specifically with THESE calls, however a little sleuthing may produce results. When I got back into DXing in '82, after being off the air for 6 years and not interested in DX for a few before that, I found I had QUITE a collection of QSO's with DX countries for which I needed a card (for DXCC credit). I got myself the latest copy of the DX Callbook and started looking up the countries (hopefully to get addresses of these old stations). More often than not, the guy you worked is still around. For example, even tho' CR6 is no longer the prefix for Angola, there aren't too many hams in that country and examining the list of (I think) D2 calls listed may reveal one such as "D2GS" with the same first name and in the same city. Bingo! Odds are you just found him! With KZ5 stations, you will have a problem, since those were military personnel stationed in the (then) U.S. Canal Zone. However, there are ways to track at least some of these folks down, assuming they're still alive and licensed. "QRZ DX" is a newsletter published exclusively for the DX community and if you write Bob W5KNE (the publisher) and tell him you'd like to find the whereabouts and QSL info for such and such (your KZ5 for example), he'll publish your request in the newsletter. Many people read it and the odds are pretty good that someone knows the guy (again- if still kicking and/or licensed) and will pass the info along. Another tip is the "GO List"- published by W6GO, this is a list of QSL managers/ QSL routes. Though most are for the more or less current crop of DX stations, there are many old stations still listed- I think he claims something like 6000 stations/ managers QSL routes.

Now- you've found him, how to get a card? I found that a letter to the guy, much more than a QSL card (or at least along with a card) is the key to success. Tell him how much you enjoyed the QSO "n" years ago, and how you really need the card (if you do) for an award, or for the sentimental value. I've found that the vast majority of these guys still have cards around, even from calls they no longer hold, or from DX-peditions long past. If it's a DX station, help him out- he may have been using a manager years ago, to reduce his postage expenses. Now you're writing him direct, asking for a card- include some postage money (at least some IRC's) so he doesn't have a real good reason not to help you- oh yeah- also a self-addressed envelope (not SASE, but SAE). I did this with about 20 countries when I got back on, and I got cards FROM EVERY ONE- in fact, I got some of the nicest letters back, welcoming me back on the air. It was fun. One thing- make sure, to the best of your ability, that you have ALL the QSO info correct (dates, times, freqs, etc.)- if he has to go through a large number of logs to find the QSO, he'll be less likely to help you.

The only bad news is trying to find a U.S. station who has changed his callsign- I have not found a good way to do this- the FCC computer doesn't hold callsign change info for very long, I guess, and they're not very cooperative. Sigh.

Well, this has been long, but I hope somewhat helpful. Good luck in your detective work.

How about a phone call to Mosley? their number is (314)994-7872. I'm
sure they will supply you with a set of assembly instructions for
little or no money, especially since the antenna is still in
current production.

This isn't a flame, but I think any info you might get regarding
assembly over the net, without having a picture to look at, would
probably be difficult to follow and could well result in the
best looking dummy load in your neighborhood.

Hope this helps.

The Yaesu Duplexer contains a low pass filter and a high pass filter.
5 airwound inductors and 5 caps. Can build one for less than a buck.
One radio on two antennas doesn't require much isolation. Be more
careful when using two radios on one antenna.

I called DAK the other day to order that little shortwave radio, and they told me the radios won't be available for delivery until April 7th. As soon as I get it, I'll post an evaluation.

>they'll refund your money.

>I have no affiliation with QSLs by W4MPY other than as a satisfied
>customer.

>73 Dave KD5RO/2

Hear, hear! I've also used W4MPY and have the same feelings as Dave. Besides being a mouthful on phone (and wrist-tiring on CW), WD6CQV/KH6 just doesn't fit on the average QSL card, but W4MPY got it all on with room to spare, and it looks good, too! Turnaround time was only about three weeks, even with the shipping time between Hawaii and South Carolina.

This discussion seems to be drifting back to "code vs no-code" via "new" ideas for licensing exams

Most of the ideas presented so far approach a call for two classes of license: (1) Radio Operator (RO), and Technical Operator (TO).
The RO license would be issued to anyone who could demonstrate proficiency
in 1. Coming up with enough money to buy a rig, computer, peripherals, antenna, software, and tuner.
2. being able to locate the on-off switch and knowing which position is the "on" position.
3. Knowing the diference between a D-type connector and a PL-239.
4. The appropriate terminology to use on 2-meter FM (voice) and packet routing.

The TO license would require substantially the same technical knowledge as is now required, with the addition of a few questions regarding FCC type-acceptance and what types of equipment may be used in which radio services.

A person could have either a RO, a TO, or a ROTO (combination) license.

In practice, a RO could not make any adjustments to equipment that would affect the frequency (other than the tuning knob(s)), the output power, or the modulation characteristics of the transmitter. But could use any FCC type-accepted equipment that they could find a way to chain together to effect communication with other stations. The TO would not be under these restrictions and could modify, build, or make any adjustments to equipment that would not result in emitting a signal outside the limits placed on the service. This would, of course, include modifications or adjustments to RO equipment.

For both the TO and RO classes (commutatively applicable to ROTO), a comprehensive operating rules exam would have to be passed. It would be an open-book exam to encourage reading and studying about the radio service they are (or hope to be) licensed for. Such an exam would be required at annual intervals to maintain this encouragement. It would cover such aspects as: (1) What the band limits are and why they are there. (2) What modes of operation are allowed on each band. (3) What to do when the frequency you want to use is occupied. (4) How to Call another station; and how to reply to a call. (5) when you need to ID your station and how it is to be done. (6) What is music and what is profanity (not a court definition, but a service definition). (7) How To Be Courteous and Considerate. (8) What the transmitter power limits are. Finally, an actual operator run, with two VE's unknown to the testee evaluating would be administered. The operator would be required to ACTUALLY operate his equipment, in the presence of the evaluators, in each of the modes he intends to run. Successful demonstration would then be indicated by checking off the appropriate blocks on the license application.

This would do for a start. The Lawyers can add myriad details to each point as they see fit. Notice that the dreaded letters, CW, will only appear at the Operator Evaluation Annual Test (OEAT), and then will apply only to those expecting to actually operate this mode.

To make sure that operators adhere to their license conditions, any operator found to be operating in a mode or manner inconsistent with his license would have his equipment seized and his zicense revoked for six months, or until his next annual renewal date, whichever is later. Such an operator would be placed in "Status Operator License Activity Revoked" category (SOLAR).

73,
Dube Todd   N5PDK   :)

The following is forwarded on behalf of Michael Covington, whose system does not now permit him to do so himself.

Date: Thu, 15 Mar 90 00:41:14 EST
From: asuvax.eas.asu.edu!CORNELLC.cit.cornell.edu!MCOVINGT%UGA.UGA.EDU (Michael Covington)
Subject: Ham radio anthropology
To: Bryan Pfaffenberger <xb.p07@forsythe.stanford.edu>
Cc: Jim Grubs <jim.grubs@w8grt.fidonet.org>

I just saw your appeal for information about the social values of ham radio enthusiasts. I've been around ham radio, and reading about it, for perhaps 25 years though I've only been licensed for two years.

(1) Ham radio is definitely egalitarian. There are awards and other status symbols (especially the ascending classes of license), but most people take the attitude that anyone could attain these with suitable effort and inclination.

Hams generally _conceal_ their social status when on the air. Just today I was browsing through QST Magazine for 1949 and came across the following story, which is typical: An American sergeant who was a ham found himself in an isolated place in Europe without supplies. He called a ham in Germany and asked him to deliver a message to headquarters. The ham in Germany did better than that -- he turned out to be General LeMay and he sent out the shipment himself.

(Computer BBSes today have a similar ethic. I've several times found myself talking to 15-year-olds who blissfully assumed that everyone on the BBS was a 15-year-old. I only "pull rank" when necessary to end a long pointless dispute.)

The use of non-voice modes (Morse code and more recently RTTY and packet) enables hams to conceal their dialect, accent, etc. I've been told that through much of this century, black hams preferred Morse code because they could communicate with whites on equal terms.

(2) Sharing ethic: Yes, certainly. (In fact I have a hard time getting hams to realize that commercial computer software can't just be copied indiscriminately.) A typical ham would rather _give_ a piece of equipment to a young new licensee than _sell_ it for a good price. Sharing of information, sharing of equipment, and selling at low prices to other hams are standard practices.

(3) Social service ethic: Definitely! To get a ham license, we have to study Part 97 of the FCC Regulations, which define the purpose of ham radio -- it includes enhancing international goodwill, serving the public, and developing or disseminating technology. Ham radio is _not_ just a hobby. Many hams enjoy doing many hours of public service work every year. We _all_ are available to be called on in emergencies. There's a general feeling that any ham who is not willing to do public service is not worthy of a license.

For example, the National Traffic System is a volunteer network that relays messages ("radiograms") for free. Right now it's just a hobby, but if there were ever a major telephone outage, it would swing into action as a valuable communication service. (Some of this happened when Hurricane Hugo disrupted communication in the Southeast.)

What's the main DIFFERENCE between ham radio and computing? I think there are two:

(a) Ham radio is ipso facto a community. You have to have people to talk to. Computing _can_ be pursued alone.

(b) Most computer hobbyists are trying, on some level, to make money with their computers. Lots of times, they do good, useful work. Sometimes, they write programs and give them away free with notices that "if you use this for more than a brief trial period, you must pay me $100" and then grumble that nobody pays the $100.

Among computerists I've sometimes found a money-grubbing attitude that is, by regulation, absent from ham radio. You _can't_ make money with ham radio (at least, not directly). It's forbidden by FCC regulations.

I think Part 97 should meet the service's minimum regulatory needs and leave
the social engineering out of it.

Does anyone have information or a pointer to information on building
duplexers for multiband antennas/radios?  Is it reasonble to try to
duplex 144/220/440 on the same cable?  I have antenna that's good for
all of them, the Austin Suburban.
thanx, and 73, doug

> 2. being able to locate the on-off switch and knowing which position is the
> "on" position.
> 3. Knowing the diference between a D-type connector and a PL-239.
> 4. The appropriate terminology to use on 2-meter FM (voice) and packet
> routing.

You leave out some important things:

People should have some understanding about radio interference, how to do what they will do CORRECTLY (e.g. hook up coax and power), FCC regulations, and safety.

Why should they need to know about connector types appropriate for HF when we are planning to give them essentiallu UHF privileges?

> The TO license would require substantially the same technical knowledge as
> is now required, with the addition of a few questions regarding FCC type-
> acceptance and what types of equipment may be used in which radio services.

What the current requirements are, in terms of technically level, are the MINIMUM that should be required for the least privilege. Anything less is just CB (IMHO).

> In practice, a RO could not make any adjustments to equipment that would
> affect the frequency (other than the tuning knob(s)), the output power,
> or the modulation characteristics of the transmitter. But could use any

Sure SOUNDS like CB now!

> FCC type-accepted equipment that they could find a way to chain together
> to effect communication with other stations. The TO would not be under
> these restrictions and could modify, build, or make any adjustments to
> equipment that would not result in emitting a signal outside the limits
> placed on the service. This would, of course, include modifications or
> adjustments to RO equipment.

NO NO NO NO NO NO !!

NEVER NEVER NEVER !!

I do not want to start having the FCC type-accepting ham gear, even though some hams can be using the non-type-accepted gear. It will just end up raising the prices for everyone.

> For both the TO and RO classes (commutatively applicable to ROTO), a comprehensive operating rules exam would have to be passed. It would be an open-book exam to encourage reading and studying about the radio service they are (or hope to be) licensed for. Such an exam would be required at annual intervals to maintain this encouragement. It would cover such aspects as: (1) What the band limits are and why they are there. (2) What modes of operation are allowed on each band. (3) What to do when the frequency you want to use is occupied. (4) How to Call another station; and how to reply to a call. (5) when you need to ID your station and how it is to be done. (6) What is music and what is profanity (not a court definition, but a service definition). (7) How

What if two people disagree on it? Who'sto say who is right, without codifying it into the rules, or hearing it in court?

> To Be Courteous and Considerate. (8) What the transmitter power limits are. Finally, an actual operator run, with two VE's unknown to the testee evaluating would be administered. The operator would be required to ACTUALLY operate his equipment, in the presence of the evaluators, in each of the modes he intends to run. Successful demonstration would then be indicated by checking off the appropriate blocks on the license application.

Not practical.

> This would do for a start. The Lawyers can add myriad details to each point as they see fit. Notice that the dreaded letters, CW, will only appear at the Operator Evaluation Annual Test (OEAT), and then will apply only to those expecting to actually operate this mode.
>
> To make sure that operators adhere to their license conditions, any operator found to be operating in a mode or manner inconsistent with his license would have his equipment seized and his zicense revoked for six months, or until his next annual renewal date, whichever is later. Such an operator would be placed in "Status Operator License Activity Revoked" category (SOLAR).

The FCC can do this already.

>I disagree with the concept of making privileges a reward. This makes it
>something like a prize.

I have to agree there. Dolphins get rewarded for jumping through hoops.
Children get rewarded for behaving in the restaurant...Don't you think
WE could make the whole process more logical (and Dignified)?

>The exams SHOULD measure how capable we are of NOT abusing the privileges
>that we want to have.

The present system is a lot like taking a Physics class and being tested
on Music Theory. Knowing Physics may help you understand why note
combinations sound dissonent or consonent, but should you have to know
one, that you will probably never use, in order to do the other?

>Prizes are offered for doing things that may in fact NOT be related to the
>nature of the prize. We should not be doing this in ham radio. VHF/UHF
>privileges are unrelated to Morse Code for most people.

Thanks Phil. How many of you have ever run VHF or UHF CW? Not a heck
of a lot of fun compared to using the low bands, is it? Why require
code testing if nobody (or practically nobody) uses that mode in that
bandspace. Stop hideing behind the defense that "If we don't test code,
Ham Radio is going down the toilet like CB". If we keep insisting on
code testing, ham radio will go down the toilet. Let's concentrate on
training our hams on emergency procedures, operational courtesy, and the
like. Let's stop allowing hams to go years without learning how to
PROPERLY participate in a traffic net. Right now, it's pretty sad.

>--Phil Howard, KA9WGN--
><phil@ux1.cso.uiuc.edu>

Thanks Phil, I think we better set some real goals for Ham radio and
work toward achieving them. If CW is legitimately part of the plan,
fine. If it has truly become a relic, let's treat it as such.

>Dube Todd   N5PDK   :)

I know this posting was intended as a joke, but I like it. I especially like the annual OEAT as this could be a good way to get an honest count of licensees who are still alive and active. I expect the number to be much smaller than reported in the flawed QST reports. I also like the idea that you be tested only on the operating modes YOU consider relevant to your needs while retaining comprehensive regulatory and technical exams as appropriate depending on whether you are a RO or TO.

Annual retesting of simulated on the air behavior might even reduce the liddism on HF a little bit. I doubt it tho -(. Lids are a social phenomina that testing will be unlikely to uncover or discourage. By and large these people are not stupid. They will be model operators DURING the test. Lids are a reflection of society's failure to integrate these people into the socially accepted norms of behavior.

>better than that -- he turned out to be General LeMay and he sent out the
>shipment himself.

I had forgotten that LeMay was/is a ham. From my online callbook:

```
Call:           W6EZV
Class:          General
Name:           Curtis E Le May
Mail addr:      1046 Pescador Dr
```

Newport Beach CA 92660
Born: November 15, 1906 (age 83)

The name and year of birth matches the info about him in "The Making of the Atomic Bomb", so this is probably him. Does anybody know if he's still alive?

An interesting, if spooky character. The more I read about him, the more I'm convinced he was the inspiration for General Buck Turgidson (George C. Scott's character) in "Dr. Strangelove". On the other hand, from an incident documented in the PBS series "War and Peace in the Nuclear Age" in which he declared his intention to strike the USSR first if he saw the Russkies massing their planes (despite this not being US policy) perhaps he was the model for General Jack D. Ripper.

Barry Goldwater, Curtis LeMay... how come the hams who rise to prominent national positions always seem to be right wing extremists? :-) :-)

Thanks to KA1GD for posting the beacon list. I have a couple of comments.

J52US and 9L1US are the same fellow and rig. He is a 9L1US now-a-days. Thus J52US should be deleted.

I think the Netherlands Antilles beacon,
PJ9B, is the one run by Chet, PJ9EE. Chet moved to Bonaire a couple of years ago and the beacon quit and was sent to him. Right now it is in my radio room in the process of being rebuilt (%$^*%**&^# Hamtronics). I'll get it back to him sooner or later. Its power is about 10 W, and will be on from Bonaire when reactivated.

It would be useful to note which beacons are A1 and which are F1. Most are A1, but FY7THF and '4OOJ are F1. 'THF sends SSSssssooooooo slowly it is hard to copy.

I just returned from a 10-day business trip to Texas and California (I'll bet you noticed the reduced net traffic). On the "middle" weekend I stopped by W3XO/5 (& XYL), who had returned the day before from three weeks in VK and ZL. Among the several hours of 8mm video was a visit to VK2TVG.

Just by chance one of the Sydney hams suggested a visit to VK2TVG. Bill had never heard of it, but was "game". It turns out that 'TVG is a ham-operated TV station, "channel 35 plus", that is in the regular UHF TV region and can be viewed by the general public on regular, unmodified TV sets. The VKs had a 576-585 MHz ham band, and the ham TV repeaters and 'TVG have been grandfathered, even though the band has been given to regular TV.

VK2TVG operates Wednesday, Friday, Saturday and Sunday evenings, with programs (oops,"tests") about ham radio. There was a "test" about working DX during Bill's visit. Wednesday carries new programs, the rest of the days are repeats. It is in commercial-quality color, and originates from a ham's KITCHEN!!!!! That end of the house overflows with switchers, VCRs, etc., etc. While the power is only 100 W (they plan more), it is relayed by other hams. It's an entirely volunteer operation that takes a crew of about 6-8 on duty during "live" periods. The hams at the station asked Bill ('XO) if we had operations like theirs here in the states.

When XO was later in ZL, he asked one of the leading ZL hams if he had heard of VK2TVG. He had; in fact they had flown him over to VK to record an 8-hour series of programs (oops, sorry) "tests".

'TVG is operated by the Gladeville (NSW) Amateur Radio Club.

An amazing operation........

perry@hpfcdc.HP.COM (Perry Scott) writes:

>One of the problems with writing down characters while listening is just
>that - you can't do two dissimilar things at once.

Hmmm, I had that problem too when I was improving my code speed. I even went to trying to write with my left hand (I am usually right-handed) to decouple my ear-brain from my hand-brain (hoping that there was a left-lobe/right-lobe distinction). Nope, didn't work :-) :-).

What I did find to work (for me) was to, every now and then, when I reach a plateau, go to hardcopying with a keyboard - i.e., type rather than write. Now, I can't type 20 wpm either (I hunt-and-peck :-), so I couldn't completely keep up with a long string of message. But, a dozen minutes of this was enough to get the silly grey cells decoupled. And I find myself being able to hand-copy to the next plateau, where I go back to a keyboard for a few more minutes. Even so, it was not painless. It took me 5 months to go from about 2 wpm (I have been SWL'ing for 25 years and could recognize Morse characters) to 25 wpm.

And, of course, Farnsworth the thing. It helped me even when I was in the 15 wpm range (Farnsworthed to 20-25 wpm).

By the way, for those of you trying to find interesting source of messages, and live on the US coastal areas, the Coast Guard transmit weather messages in the LF/VLF region at about 18 wpm. Less boring than test tapes. Me? I wrote a program on an AT that keyed a pin on the printer port. I then used that to key an oscillator which fed the antenna spigot of a receiver. The source text that I fed the program were messages from rec.ham-radio (no kidding!), quite often the long ARRL bulletins.

NOW - here is an interesting one - I have been discussing this over lunch with an old friend who I am trying to prod to getting a Tech license. He is probably close to tone deaf, and his XYL and epsilon could copy better than him by just listening to him practice. It is like half a year now and he still cannot make 5 wpm. This OM needs help! :-) :-)

So, I suggested that he copies the dots and dashes down *verbatim* (hey, I think it *is* possible at 5 wpm) on the piece of paper they give you. Then, in the time they give you to answer the 10 questions, you translate the dots and dashes into Roman alphabets. I doubt they will ever give you credit for the "1-minute solid copy," but surely they have to pass you if you get 7 questions answered correctly, don't they? (My copy sheet for 20 wpm was pretty illegible, too, afterall :-)

OK, this is not in the spirit of the thing, but there simply are people out there who just *cannot* make 5 wpm. Any VE's out there want to comment? Would you pass a guy who does this?

Hi everybody,

I am a beginner to HAM and don't know where to start.
Are there books that would help me start?
Is there an exam that HAM users take (for acquiring license maybe)?
I am in Wichita KAnsas, Is here a group that I can get in touch with?
Please suggest a low cost equipment that would weather the trials of a beginner!
Please e-mail me at

pxgovind@twsuvax   (on the BITNET).

Thanks in advance   g.prakash

I vote for TORO. [:-)

Seriously, your ideas are very good - especially the on-the-air test on operating practices and CW proficiency. My only problem is, how do we certify VE qualifications? As we all know, those who already have licenses can't be presumed to know the gentlemanly rules of the road. Perhaps VEC's should be required to examine their VE's.

In article <35151@cci632.UUCP> dvh@cci632.UUCP (David Hallidy) writes:
>The only bad news is trying to find a U.S. station who has changed
>his callsign- I have not found a good way to do this- the FCC
>computer doesn't hold callsign change info for very long, I guess,
>and they're not very cooperative. Sigh.

Don't give up the ship quite so quickly on these. With the excellent new search capabilities that Devon has built into the marvin callsign server, you can look up someone by last *and* first name. If he or she is still licensed, that ought to do the trick.

Patty

I have recently acquired a Product Guide from Toshiba covering visible 670nm laser diodes. I expect they will be quite expense for awhile. Their phone number is 714-455-2000. Part number is TOLD9200.

Does anyone know of a good primer for first time laser hackers?

Those of you in cold areas probably found out about this the hard way. But if you live in warm areas, you may want to take a look at your antenna to see if you are getting trapped water. Before corrosion gets you.

copied from packet (source unknown):
SUBJECT: - files\G7-ANT.MOD

IMPORTANT! YOUR G-7 WILL HAVE A PROBLEM IF IT WAS MFG. BEFORE 23 MAR 88. YOU MUST DRILL A DRAIN HOLE AT THE BOTTOM OF SECTION #5892 THAT IS THE ALUMINIUM TUBING JUST ABOVE THE LOWER PHASING COIL. SPACE THE HOLE AS THE ONE AT THE BOTTOM, JUST BELOW THE FIRST CLAMP. MY G-7 LASTED ABOUT TWO MONTHS AS A REPEATER ANTENNA ON A MOUNTIAN TOP BEFORE THE #5892 SECTION FILLED WITH WATER, FROZE, AND PUSHED THE PRESS FIT PIECE AT THE BOTTOM OUT ABOUT A 1/2 IN. AND PUSHED THE #5891 SECTION WITH THE REST OF THE ANT RIGHT OUT AND SOMEWHERE INTO THE WOODS. ...

ARRL Letter - Volume 9, Number 4 - February 27, 1990 - Part 1 of 3

FCC RELEASES TEXT OF NPRM FOR CODELESS LICENSE

In its release dated February 16, the FCC detailed its rationale behind several issues regarding its newly proposed Communicator Class of amateur license. The FCC sees Communicator as the class of license which most newcomers into the hobby would elect to qualify for. This premise was used as the basis for its proposed elimination of the Novice Class license. Since FCC also proposes a comprehensive 60 question written test for the Communicator, they contend that the Communicator Class will also take the place of the Technician Class for future licensees.

Under the FCC proposal, "a Communicator Class licensee who passes, or otherwise receives credit for a telegraphy examination, would be authorized the additional privileges of the Technician Class." FCC intends to further simplify its documentation process by permitting Volunteer Examiners to issue a Certificate of Successful Completion of Examination (CSCE) as proof of a Communicator's code proficiency instead of formally upgrading them to Technician. The upgraded Communicator would sign their call followed by the identifier "/AC" and it appears that they would do so indefinitely or at least until they upgraded to General Class or higher. Volunteer Examiners would be permitted to issue a CSCE to Novices successfully passing the Communicator written exam. Under the proposal, VECs would provide listings to the FCC of the Communicators with the Morse code endorsement. Finally, the FCC proposes that all examinations be administered by Volunteer Examiners saying that the VECs provide more credible results than does the two examiner system now in use for Novice examinations.

The deadline for filing comments with FCC is August 6, 1990. Between now and the July 20-21 meeting of the ARRL Board, the Directors are looking forward to hearing from as many members as possible to assist them in determining the League's response. The full text of FCC's codeless proposal will appear in the April 1990 issue of QST.

FCC ISSUED CALL SIGN UPDATE

The following is a list of most recently issued FCC call signs (February 1).

DIST	GRP"A" Extra	GRP"B" Advanced	GRP"C" Tech/Gen	GRP"D" Novice
0	WZ0N	KF0HR	N0LMJ	KB0FVV
1	WC1W	KC1TG	N1HID	KA1VCU
2	WV2T	KE2RK	N2KGM	KB2JID
3	NY3G	KD3QX	N3HUR	KA3VSO
4	AB4TE	KN4DY	N4XZO	KC4OMH
5	AA5QF	KI5CH	N5PYD	KB5LPN

6	AA6TX	KK6GE	N6XUD	KC6ILF
7	AA7DH	KF7ZZ	N7OFE	KB7JQL
8	WY8Z	KF8EB	N8LUR	KB8JAQ
9	WO9B	KE9UN	N9JGE	KB9DZH
Guam	KH2M	AH2CF	KH2EI	WH2AMK
Hawaii	***	AH6KG	NH6VV	WH6CGO
Alaska	***	AL7LU	NL7TJ	WL7BXA
USVI	NP2F	KP2BS	NP2DO	WP2AGZ
P.R.	***	KP4QK	WP4XK	WP4ISQ

*** indicates that all 2 x 1 call signs have been assigned in those areas.

The N-prefixed Group C (1X3) call# signs blocks for the fourth and sixth call districts have nearly all been assigned. After N4ZZZ and N6ZZZ have been issued, FCC will begin assigning calls from the Group D (2X3) call sign block.

NEWS FROM THE ARRL DXCC DESK

Walvis Bay (ZS9) was added to the ARRL DXCC Countries List by unanimous vote of the ARRL Awards Committee on February 22. Walvis Bay is an enclave of the Republic of South Africa, surrounded by territory of Namibia. DXCC credit will be given for contacts on or after September 1, 1977. QSL cards may be submitted for DXCC credit on or after June 1, 1990.

The 5 Band DXCC Award is now endorsable for 17 and 12 meters, in addition to 160, 6 and 2 meters. These endorsements are available only for those who have already qualified for 5BDXCC on the basic 80, 40, 20, 15 and 10 meter bands. Send an SASE to ARRL Hq for the endorsement application form.

FCC SHUTS DOWN UNLICENSED BROADCASTER

Working together, the FCC Baltimore and Detroit Field Offices located and shut down an unlicensed West Virginia pirate broadcast station on January 30. Mark R. Leavitt was fined $1000 for illegally operating on 3.820 MHz in the 75 meter amateur band.

Unauthorized operation of a radio transmitter is a violation of Section 301 of the Communications Act. Sanctions may include fines from $10,000 to $100,000 and/or imprisonment for up to one year.

ARRL Letter - Volume 9, Number 4 - February 27, 1990 - Part 2 of 3

ARRL COMMENTS IN FCC WARC-92 INQUIRY

The ARRL has filed its comments in response to an FCC inquiry in general docket 89-554. FCC sought information to assist in addressing the allocation issues likely to be raised at the 1992 ITU World Administrative Radio Conference. In its introduction, ARRL said that it recognizes the significance of the Inquiry and... "stands ready to participate fully in the process leading to the US position at WARC-92."

A primary concern for amateurs at the upcoming WARC is the issues that deal with spectrum allocations for HF Broadcasting. FCC asked for comments on the projected needs of the HF broadcasting service. The League responded saying, "There have been dramatic changes in the world since HFBC-87 [WARC for the Planning of the HF Bands Allocated to the Broadcasting Service. Second Session. 1987].. These changes are relevant to the projected needs for additional HF broadcasting service allocations." Some of these "dramatic" changes include: a significant reduction in jamming; easing of restrictions in certain countries which formerly discouraged pluralistic views in their countries; and increasing delivery of information and other material to target audiences by new communications technologies. The FCC also asked whether HF Broadcasting allocations have to be exclusive and, if so, should these allocations be regional or worldwide. To this the ARRL responded, "The HF broadcasting service uses high power transmitters and directional antenna arrays to deliver high field intensities capable of overcoming the insensitivity of inexpensive receivers with built in antennas. In contrast, the amateur... service uses lower transmitter power and more sensitive receiving systems. As a result of these disparate power levels, it is difficult for any other service to share allocations with the broadcasting service.

"... The amateur service in Region 2... has a requirement for access to 500 kHz of spectrum in the vicinity of 3500-4000 kHz because of the great reliance that is placed on use of this band for emergency communications networks. The requirement for access to 300 kHz of spectrum in the vicinity of 7 MHz is equally great, and is growing because of the diversity of modes of emission now being employed by amateurs. Interference from broadcasters is a limiting factor at 3900-4000 kHz and 7100-7300 kHz. As severe as this interference can be, amateurs do make effective use of these allocations... and often can find narrow frequency gaps between broadcasting stations where communications can be conducted even in the presence of interference. Loss of access to any part of these allocations would deal a severe blow to amateur disaster communications capabilities in Region 2. Those capabilities are now substantially lacking in Regions 1 and 3 in the absence of an adequate 7 MHz amateur allocation."

Commenting on other questions regarding frequency allocations affecting amateur bands in the UHF and SHF regions, ARRL noted "There are three amateur service bands within the 0.5-3 GHz range of interest for expansion of mobile-satellite and [other services], namely 902-928, 1240-1300 and 2300-2310/2390-2450 MHz." The League commented that the none of these bands are suitable for additional sharing as they are already being shared by Industrial, Scientific, Medical (ISM) and government radiolocation services, and at intervals throughout the remaining spectrum to 300 GHz.

With regards to proposed new space services above 20 GHz, the League commented that the needs of the amateur and amateur satellite services should not be overlooked when allocations are make for new services. Currently, there are amateur allocations at 24-24.05 GHz on a primary basis and at 24.05-24.25 GHz on a secondary basis with radiolocation services.

The ARRL also commented.."Should the agenda for the conference permit, the US should as a matter of policy pursue the opportunity to effect increased allocations to the amateur services..." including: a new shared allocation with a bandwidth of 50-100 kHz in the vicinity of 5 MHz; an expansion of the amateur allocations at 10, 18 and 24 MHz; and a 50 kHz expansion of the allocation near 14.350 MHz. In addition the League requested that the amateur service allocation in Region 2 at 7.1- 7.3 MHz now subject to harmful interference from high power broadcast stations, be to the amateur service worldwide. ARRL said that it would be ready to provide further justification at an appropriate time.

In its concluding comments, the ARRL said "In 1988, the United States Congress adopted... the Federal Communications Authorization Act of 1988. Among other things, this law stated the sense of Congress that... Government agencies shall take into account the valuable contributions made by amateur radio operators when considering actions affecting the Amateur Radio Service... this legislation made it clear that the intention of Congress... was to urge government agencies that have such jurisdiction to avoid actions which would reduce amateur service frequency allocations. The League urges that this same goal should be adopted by the Commission in its preparatory efforts for WARC-92."

ARRL Letter - Volume 9, Number 4 - February 27, 1990 - Part 3 of 3

FCC STARTS WHEELS TURNING ON ARRL "PART 97 CLEANUP PETITION"

The FCC has assigned file number RM-7243 to the League's petition of November 14, 1989, to revise certain sections of Part 97 of the rules governing the Amateur Radio Service, better known as the "Part 97 cleanup petition." The purpose of this petition is to request the FCC to consider certain changes that they did not deal with in PR Docket No. 88-139, the major Part 97 rewrite which became effective on September 1, 1989.

The FCC's stated purpose of the 88-138 proceeding was "reorganization and deregulation of Part 97." Reorganization amounted to changing the order of the subparts and sections, which had become patchwork. The deregulation goal could be measured by the number of pages eliminated from the rules; of course, there was hope for some simplification as well. In its comments to the FCC concerning their proposed rewrite, the League made numerous recommendations, which took the form of a complete new draft. The FCC's Report and Order contained many of the League's recommendations, decided that others were substantive changes and beyond the scope of Docket 88-139, but left the door open for changes under a new proceeding. That's when the ARRL Ad Hoc Part 97 Rewrite Committee was called back into service to draft a cleanup petition.

In its petition, the League asked the Commission for a number of substantive changes. One was to ease restrictions on transmission of third-party traffic when operating under automatic control on frequencies above 50 MHz, which presently allows such operation only when using AX.25; this would eliminate the nee for a control operator to be on duty whenever a voice repeater is used for a traffic net. The petition made a strong appeal to the FCC to amend section 97.121, which presently permits the Field Operations Bureau to restrict an amateur station operation, and entitle the amateur to a hearing in accordance with the section 316 of the Communications Act. The League again asked for relief from "the amplifier ban," which posed frequency and minimum drive power restrictions on commercial ampliiers because of illegal CB use. The present restrictions deprive amateurs from the opportunity to purchase amplifiers for the 24- and 28-MHz bands. The League feels that the restriction in section 97.515(c) that "no person may be a VE if that person's amateur station license or amateur operator license has ever been revoked or suspended" is overly harsh and that a person should be considered eligible to service as a VE ten years after such termination. The ARRL reiterated its request to permit amateurs to retransmit Department of Commerce time signals, weather and propagation forecasts.

As for cleanup, the League asked for definitions to be added for ASCII, AMTOR and Baudot codes, digipeater (to distinguish it from a voice repeater), emergency communications and tactical call signs. Technical improvements in the definitions of bandwidth and spurious emissions were also sought. The League also asked the Commission to add space telecommand, space telemetry, telecomand and telemetry, and to bring them into agreement with Part 2 of the rules. Additional amendments in some sections were recommended to reflect the definitional changes. The League recommended that the rules be amended to require at least four persons to constitute a club, as opposed to the present two persons. The cleanup petition requested flexibility in use of radio apparatus aboard a ship or aircraft; current rules require separate radio equipment for amateur operation, except that a common antenna may be used. The petition asked that the requiremnt that bulletin or code practice stations, for which material compensation is not prohibited (example: W1AW), transmit on all MF/HF bands be reduced to six MF/HF bands.

RTTY DX Notes for Weekending 16th March 1990.
Part 1 of 3.
BID: $RTDX1603

One wonders at times about some of the DXpeditions that explode on the DX world, and promise QSL cards immediately on receipt of green stamps. And there the matter seems to come to a halt. Take for instance JT0DX and the operation of September last year. When, if ever, are the cards to appear? Maybe they are still stuck in a printing press somewhere.

Our thanks this week go to I5FLN, JA1BLV, OD5NG, TG9VT, VE3JPC, VK2EG, W1DA, W1UU, W0LHS and others. Thank you all for your help with these notes.

RTTY DX Notes, 3of3, 3/16/90

RTTY DX Notes for Weekending 16th March 1990.
Part 3 of 3.
BID: $RTDX1803

ZS8MI will QSL via ZS6PT.

UB4HQ will collect his cards from Box 701, Poltava, 314011. USSR.

BY9GA will QSL via Box 12, Lanzhow, China.

UA2WJ will QSL via Box 535, Kalingrad 326061. USSR.

Notes Of Interest.

J28TY has been reported on 3584 and 7035 KHz around 2000Z.

LY2WW has also been reported on 3583 KHz around 2200Z.

RL8PYL, Alex, will fly to Vietmam on 18th March on his way to Spratley. He will operate in Vietnam before and after the Spratley trip, which means that the Spratley deal may be delayed for a few days. Also check the available information regarding donations to Vietnam. There is still some doubt.

EA9JV reports that he cannot get any vacation in time for the SO1 and 7X trip, so his part of the operation will be delayed. More later.

The Sahara part of the trip by the Lynx group is still going to happen.

Lord Howe Island. Well, you can forget it for this trip. There will be no RTTY, oh shucks.

Aves Island. The Venezuelan Radio Club will operate from Aves Island on 11th to 15th April as YV0AA. They will use RTTY, AMTOR and packet. QSL to Venezuelian Radio Club, Box 2285, Caracas 1010-a Venezuela. Put the expedition call on the envelope.

Jarvis Island. A group will go to Jarvis Island April 13th to 23rd and operate under rule 3b of the DXCC criteria. QSL to Box 2368, Stanford, CA 94309-2368.

JA3PFZ reports that there is a plan to operate from XU and XZ in the near future. More later.

GL DE DX1.

3/16/90 test
This is Friday, 3/16/90.
Tad, these bulletins were changed from allus to rttydx
as per our email of last week.
/EX

I will be out for an extended period.   In my absense please
contact Paul (REGENT::)Nelson for items that will not wait
for my return.

Bob

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

UOSAT-OSCAR-14 and UOSAT-OSCAR-15 REPORT #007 15-Mar-90

** UoSAT-OSCAR-14 **

Attitude Control and Stabilization

Manueuvers prior to gravity gradient stabilization have taken somewhat longer than expected. The most recent delays were caused by the need to add digital filters to the attitude determination software to remove unwanted noise from the magnetometer readings. The filters have been installed, and a new version of the FORTH diary will be uploaded soon.

High Speed Downlink Tests

The UoSAT Command Station has been conducting limited experiments with the 9600 bits/second Frequency Shift Keyed (FSK) downlink on UO-14. These tests have been quite successful, doubling the highest digital link speed previously used on any OSCAR satellite (4800 bps is routinely used on UO-11).

Data transmitted during these tests has been either asynchronous telemetry from the Very Large Scale Integrated telemetry system or continuous streams of 1 bits (no data at all). The "stuck ones" tests are very useful because of the scramblers in the modulator and demodulator. The 1's are scrambled and transmitted as pseudorandom data over the RF link. The groundstation demodulators then lock onto this data, descramble it, and reproduce the continuous 1's. Any 0's in the demodulated output data stream are caused by bit errors on the communication link, and the link bit error rate (BER) can be calculated from the frequency of such transitions.

BER tests are to be scheduled into the DIARY in aid of those trying to test their FSK receive system. The first scheduled tests were scheduled for the morning passes over the East Coast of the US on 15 March.

- de G0/K8KA.

** UoSAT-OSCAR-15 **

The team at Stanford has succeeded in detecting local oscillator (LO) leakage from the UO-15 command receiver. The weak signals were first detected on March 10 and then again on March 11. Roy Long, leading the Stanford Research Institute team on the recovery attempt, said that there is no dbt that the signal comes from UoSAT-15. It is weaker than the corresponding signal on UoSAT-14, as expected from prelaunch measurements.

Each UoSAT carries three receivers: a fixed-frequency command receiver and two communications receivers with switchable frequency. Efforts will now concentrate on monitoring one of the switchable frequency receivers. If one of these receivers is heard, commands will then be sent to change the receiver frequency, which should cause a corresponding change in the LO frequency. Observation of changed LO frequency will confirm that the satellite's command system is basically healthy.

The work at Stanford is very time consuming, requiring azimuth and elevation control of the huge Stanford 150 diameter dish to within tight limits. Data are collected for only a few seconds, followed by hours of post-processing.

Does anyone have instructions on how to modify an Icom 2GAT so that it can transmit out of the ham bands. I work for my campus police department and have had several occasions where it would have been convenient to be able to contact them without the trouble of having to first find a 10-21(landline).

If anyone has sucessfully completed this Mod, I'd appreciate it if they could send me some instructions on how to do it.

The freq's I'd need are in the 155-157 MHz range.

NOTE:: I don't have my license yet, though I recently passed my tests through technician. If nothing else, this will give me something to do with my radio until I can use it on 144-148.

I disagree with the concept of making privileges a reward. This makes it
something like a prize.

The exams SHOULD measure how capable we are of NOT abusing the privileges
that we want to have.

Prizes are offered for doing things that may in fact NOT be related to the nature of the prize. We should not be doing this in ham radio. VHF/UHF privileges are unrelated to Morse Code for most people.

I have been given the following information to distribute:
(Any email enquiries, I guess, should come through me)

alan.

The Newcastle Brick Award

Newcastle Earthquake Appeal

Amateurs Helping Rebuild Newcastle

In conjuction with the Australian Broadcasting Corporation's Radiothon for the Newcastle Earthquake Appeal, members of Newcastle's Amateur Emergency team, called WICEN, will be broadcasting for 22 hours from 1400 UTC on Saturday March 17, until 1200 UTC on Sunday March 18, on the following bands as conditions permit.

3.610 MHz
7.090 MHz
10.130 MHz
14.280 MHz
21.190 MHz
21.280 MHz

28.510 MHz

There will be 3 awards for contacting the station.

Basic Brick	AUS$3
Big Brick	AUS$5
Super Brick	AUS$10

Help Newcastle amateurs dispose of bricks to help rebuild Newcastle. A magnificent award created in honor of this occasion. And, in honour of this occasion, a special callsign, VK2EQA, has been allocated for the period.

All mail including QSL cards and payment should be addressed to:

Newcastle WICEN
c/- ABC Radio
Newcastle 2300
Australia

I am sysop on a 220 Mhz repeater in San Diego County. We have had the Advanced Computer Control's RC-850 repeater controller online since 1987. I'm looking for anyone with experience with the same controller. I have found numerous bugs with the firmware and would like to discuss mutual problems.

We started with firmware version 3.41 and upgraded to 3.42 as soon as it was released. The revision was nice in many respects but somewhat clunky in others. We are runnings the 850 with the voice option, no DVR, UF functions in latched, 3 remote bases, control receiver, home-brew autopatch at the site and 1 remote auto-patch using firmware support of REMOTE PHONE 1.
Overall, we have been very pleased with system even with some of it's short-commings. I have talked to ACC by phone a few times about the clunker bugs, but they were'nt to concerned by them and, I doubt, that they even logged them for fixes in later releases.

I would now be interested in a MS-DOS based controller with voice support.
Anybody want to comment on this aspect of computer-controlled Ham repeaters.

Thanks, 73's

...Mike

ps--this is a repost in case ya missed it or did'nt think it mattered the first time around. Thanks,   ...Mike

I am sounding like a legal eagle, too, by sticking to my position and asking
you to show how it is that what I described is a repeater. I see nothing in
it to indicate it is a repeater. The received audio is not (significantly)
repeated in the transmission due to an isolation bridge in the actual phone
connection. Some will leak through, but it would be quite low.

> As I understand the intent of the bandplan, repeaters are intentionally excluded
> so there will always be freqs for mobile to mobile, etc. I also feel, personally
> that high site remote bases should not be parked on simplex freqs with xmit
> enabled for the same reason. Leaving rx enabled is fine.

As long as your argument is based on your believing that my idea is a repeater
then I can only consider it a moot argument.

There may be arguments for not putting a non-repeater autopatch on simplex
frequencies, but repeater frequencies are also NOT the place for it. Think
it through again and see what you come up with. Maybe we need to redo all
the bandplans to accomodate new things. That means reducing the number of
frequencies usable by repeaters, of course.

> With the cross band *remote base* (not repeater, as the ads say) capability of
> the newer radios, It is even more important. Otherwise, some rptr operator
> gets a call from an irate simplex user (or, worse freq. coordinator) wanting

> figure out that some new kenwood/yaesu/icom owner is leaving his dual band
> parked in remote base mode. (Usually using his 2mtr handheld to hit a 440
> repeater from his house)

First of all, why is it that the simplex user or the coordinator didn't copy
the call sign of the guy operating the crossband repeater? If he did have it
identifying, then it should be copied and that tells you what is going on.
If he did NOT have it identifying, then it is illegal, period.

Some are simplex and some are duplex. The duplex ones can be easy set up to
cross a repeater pair from one band into a repeater pair on another. This
reduces the problem somewhat. It would be nice if these radios had separate
power level selection on each band.

It would be prudent to use CTCSS in these cases. In fact I intend to do so
for my crossband autopatch. I also believe ALL repeaters should be REQUIRED
to use CTCSS.

> This happens regularly in our area. Sometimes even worse scenarios occur,
> like when the new radio owner sets his radio for 2 rptrs, rather than
> 1 rptr & a simplex freq. Instant ping pong once one of the rptr's is kerchunked.

Are all these examples of people doing things wrong supposed to justify why people who would do things right should not? This same kind of reasoning can be used to eliminate ham radio altogether just because there are a bunch of lids on 20 meters.

> anyway, that's my $47 worth. neat idea though!

Well, I do plan to go through with it. If you can determine how it is not legal, I am interested in hearing it. If you can explain why it is a repeater even though it is not repeating anything, I'd like to hear that as well. Suggest a pair of frequencies for it (say, for your location).

The best that I can determine is the
shipping charges are designed
to ensure that money is made even if
the customer returns the product.
By something for $100 with $15 Shipping, etc.
Money back guarantee.
Return it; get back $100.
Company has $15 for its effort.
Others may argue that $15 doesn't cover costs but it sure helps.

Many money back companies work that way.
I use the shipping % of price as a filter of who not to order from.

Well, this isn't really about digest V90 #277 but the computer gave me that subject.

What value capacitor would anyone recommend to be put accross my stereo's speaker terminals to stop humming caused by Xmting on 2m? I amagine that this would happen too (probably even worse) with HF. The RF gets into the stereo so bad that when transmitting at high power, it kicks in the stereo's protection circuits and turns off the speakers for a few seconds. Also what voltage? Stereo specs say max of 65W/ch.

Hmmm. (pun) Thanks!

I'm almost certain that the "pock-a-pock" noises you refer to are from frequency hopping HF radios. I have also heard them for the last few years -and with ever increasing frequency (Ha ha -no pun intended). At the IEEE Milcom '88 Conference Hughes Radio had a demo booth with some frequency hopping PRC-104A HF packsets. When you listened in on a third non-hopping mode radio you heard only that familiar "pock" sound.

I would assume that the hopping can be spread over any portion of the 2-30 MHz range of the radio if it can switch fast enough. (Pin diodes in the antenna tuner and half-octave filters?) Propagation between stations would probably dictate a smaller chunk of spectrum -possibly explaining the large number of "pocks" you can hear on a single frequency.

If you (like myself not too long ago) think the Big 3 ham manufacturers are the last word in HF technology then you should get a recent copy of "Jane's Military Communications". There has been a big resurgence in the popularity of HF for point to point communications in the past 10 years.(Even with satellites.) Every country with a decent section in Jane's has hopping HF systems in service. Check your public library for Jane's.

>Does anybody have a recommendation for a qsl card
>maker?
>[. . .]

Well Jon, I made my own cards, and am quite pleased with the results. I used a formatter (troff) to make a custom "back," as I work only QRP CW, so didn't need the standard "CW/SSB" or "Power" choices. I took a bunch of B/W pictures of me "out in the wild" with my QRP rig, and then went to a local printer for advice and to get the cards printed. Cost for 1000+ cards, foto on one side, with call and QRP ARCI logo in red, came to just over $100. The card almost always gets comments, even if it is "You sure are ugly" :-)

I have been giving some thought to how an international dx contest can be designed so that anyone/anywhere has a chance to win with no regard to how much money you have or the type of QTH you have. The secret is in the rules (eg multiplier maybe a funtion of ERP ... perhaps a log function). In addition there would have to be some kind of multiplier that accounts for local propagation conditions (eg. if you live close to the artic circle you are subject to more severe propagation distubances than if you are near the equator). Perhaps beacons could be usedand a multiplier derived that is applied at the point of submission of contest logs.
I know that this is not a trivial design problem. I sure would like some feedback and ideas!

In article <545@ssc.UUCP> tad@ssc.UUCP (Tad Cook) writes:
>Did anyone notice the new allocation for low power transmitters
>under Part 15 at 13.553 to 13.567 MHz? It is mentioned on page
>7 of the March issue of Monitoring Times.

The frequency of 13.560 MHz +/- 7 KHz is already assigned by the FCC as an Industrial, Scientific and Medical Frequency. Things like diathermy machines, plasma generators, and dielectric heaters operate on these frequencies. Some other ISM frequencies are:

```
     6.78 MHz       +/- 15 KHz
    27.12 MHz       +/- 163 KHz
    40.68 MHz       +/- 20 KHz
      915 MHz       +/- 13 MHz
     2450 MHz       +/- 50 MHz  (Home microwave ovens)
     5800 MHz       +/- 75 MHz
    24125 MHz       +/- 125 MHz
    61.25 GHz       +/- 250 MHz
   122.50 GHz       +/- 500 MHz
   245.00 GHz       +/- 1 GHz
```

Most ISM equipment operates at high power (I have two 20 KW units here that will be surplus soon) with unfiltered power supplies. A few low-power signals here probably wouldn't be noticed. Count on the low power stuff to have to accept the interference.

>Robert,
>I would return the computer to the place of purchase ASAP. A class 'A'
>computing device is 10dB louder than a class 'B' device.

Not necessarily - a computing device which says that it is "class A" simply means that it (more precisely, samples of this model) has been tested and certified to pass the FCC requirements for a class A device. It may actually be significantly quieter than another device labelled "class B" but was for various reasons not tested to that standard. (Class A is, in general, a looser requirement than class B, but there are other considerations taken into account by manufacturers when they choose which class to certify to.)

Even Class B devices may cause annoying interference, if they happen to generate RFI at a particular frequency of interest to you - as may be the case here. Also, not all interference comes over the power lines, so it's not too suprising that adding a line filter didn't help. (Actually, given that it's relatively simple to keep VHF frequencies off the power cord, I would've been surprised if conducted interference had been the culprit here.) You are more likely seeing interference radiated from the system. Some possible means of reducing interference in any event:

1. Make sure the computer is on a different power line than the unit being interfered with (primarily useful in the case of conducted interference).

2. Make sure that the computer's case is assembled correctly, that all screws are in place, and that the proper cables and connectors are being used. (One very common source of interference is from the system cables, esp. when the connectors being used do not provide the proper ground/return path.)

3. If you suspect that any of the peripheral devices are causing a problem, disconnect their interface cables one at a time to isolate the problem. If you can isolate the faulty unit or cable, half the battle's over.

4. If you have opened the computer's case to install optional cards, etc., make sure that such cards are properly installed and that all grounding screws, etc., are in place. (And then, see item #2!)

5. The monitor is a likely suspect in computer interference problems; check to see if your problem comes from the video by disconnecting/re-connecting the video cables, and turning the brightness up and down, while noting the effect on the interference.

6. Finally, noise can escape to the outside world through slots and other openings in the computer's case. Ideally, all digital electronics would be sealed up inside of completely closed metal boxes, but the need for cooling and connectors makes this difficult. However, if you can do so without comprising the unit's cooling or electrical safety, closing up opening with something conductive - copper tape is the most common solution - can be helpful. Slots between interface cards is one common area of leakage. NOTE: DO NOT do ANYTHING to your machine unless you're CERTAIN that you can do it without compromising cooling or safety. Also, be careful of damaging your *warranty* through any such mods.

SuperMorse is the evolutionary product of CW111 and CW102. Lee Murrah wrote both of the programs and they are excellent for code practice on the PC. The latest version of supermorse (SM309.*) will also allow you to connect to another person via modem and practice CW with each other.

All in all a VERY good package. I have it available on my BBS at 317 882 9330, just login as Ham Radio with a password of yagi. This will allow people to download on their first call to the system.

I just had a very strange thing happen with my PRO-2004 scanner, and was wondering if anybody has an explanation. I was attempting to re-program several frequencies, but in certain ranges it would add 3.2768 mHz to the frequency I keyed in! For example, I would key in 160.0 but as soon as I press ENTER it would change to 163.2768 (the last digit was smaller than the rest). Likewise 154.31 would change to 157.5868. After fiddling with it for a while to determine the range(s) effected, I noticed they would "narrow" after repeated attempts, and after about 30 minutes of fiddling, the scanner finally accepted the frequencies as I input them. I tried power off/on and reset to no (immediate) avail. It acted as though it forgot how to be programmed after many idle months!

Has anybody else had similar experiences? Any thoughts? What's magic about 3.2768 mHz?

Phil Howard says
> I disagree with the concept of making privileges a reward. This makes
> it something like a prize.

My Webster's defines privilege as "a right or benefit granted as a peculiar

advantage or favor". Phil may not agree with the concept, but until the meaning of the word changes, I guess we'll all have to live with it, or quit calling our amateur activities privileges and call them something else.
In my opinion, I think "privileges", as defined by the dictionary, fits the situation perfectly.

You sounds like one of those "HF bigot OF's". I hope this isn't true.

The assumption you made is an assumption a lot of hams are making which is what is making this whole process so difficult. Lots of hams are so wrapped up in HF hamming that they forget that there are bands above 10 meters and they don't realize this it is THESE bands that are the issue in the "no-code" matter.

NO, we do NOT want more hams on the HF bands. The HF bands are TOO CROWDED as it is. We do not face significant threat of loss of HF bands due to lack of use. 40 meters appears to be facing some threat from broadcasters, but that is a different issue.

What we DO WANT is more hams on VHF and UHF and SHF bands, most particularly on UHF and SHF. These bands are the threatened ones.

Whether I.L. has failed or succeeded is UNIMPORTANT. It merely stands in the way when combined with FCC computer limits, of implementing a workable licensing structure for making access to VHF/UHF/SHF based on the actually needed competency.

If you can reduce the number of classes with HF privileges to FOUR, then the problem can be dealt with. Try it and see what you come up with.

MY IDEA of a ham exam is not too far from what we have now, except in its level of comprehensiveness.

The REGULATIONS exam SHOULD be an "open book" exam, since what we really should be pushing is the ability to look up and understand the rules, not memorize them. The questions, and there need to be more of them, ask questions generally requiring the lookup of most of the rules. The VEC's are NOT to provide a copy of the rules, so if you don't own a copy yourself, then you memorize anyway, or fail that section. I recommend 40 to 80 questions for this section.

The THEORY should cover the electronics and radio knowledge necessary to understand what radio is, how radio waves are made, propogated, modulated, amplified, etc. There should be many questions on how various kinds of interference to other communcaitions, amateur and non-amateur, can occur. The lower theory exams should cover the basics of RFI prevention and cure. The upper theory exams should cover things more comprehensively, including these aspects of the design of radio transmitters. Any aspect of radio or electronic theory, which if not known would NOT result in interference to any service or result in a hazard to life or property, does not need to be in the exam. Safety for oneself and others must be in the exam, of course.

As you can see, it is not too much different than it is now. I would put more emphasis on things like RFI and Safety and not so much on propogation.

Amateur privileges should be granted to those who can prove they are capable of their proper use, and be retained by those who practice their proper use. Amateur privileges should NOT be a reward for any "song and dance" such as proving that one can copy Morse Code to get privileges unrelated to it.

We should generate the tests by computer. For each question on the exam, there should be a set of a few algorithms that can generate an applicable question. An algorithm would be chosen at random by the computer, and then the actual values for questions requiring computation, would be chosen at random from a large set of reasonable values. The same algorithm should also choose alternate false answers of different varieties. The pool of algorithms should be public, but would potentially result in millions of possible questions, certain of the computational ones. It is necessary to publish the algorithms for assurance of the correctness of the exam. No one could blindly memorize the answers because there are so many possibilities. Short term memorization of the actual facts and formulas is still possible, but that can be addressed by there being more questions on the exam and thus covering more things.

The passing grade should be 80% on BOTH the regulation AND theory exams parts.

Here is another idea. We could use ONE exam for two or more levels of classes and base the class on the level of passage. For instance a single exam would earn a lower level license if it was passed by 75% and earn a higher level license if it was passed by 90%. One should have to pass BOTH the regulation and theory exams by 90% to earn that level.

I have recently aquired a Regency RH256 Radio. It is a sixteen channel
programable VHF radio. No instructions came with the radio, but it is
my understanding that it can be programmed in the ham band as well as the
land mobile radio band. (and is FCC type accepted).

Does anyone know how to program this radio? Any help would be appreciated.
Thanks...

Well...

I think that the exams should have a lot more on good operating practices and a lot less on widely varied technology. When we run the hurricane watch net, our biggest problem isn't that someones rig has a technical glitch - it's that the computer between some of the operators' ears is defective. At least these people would have had to memorize some questions such as:

3A:

You live in Michigan are curious about a hurricane about to hit Florida. There is a Hurricane net operating on 14.325 forwarding weather and damage reports between the affected area and the National Hurricane Center. You should:

(1) Say "break break break" and then ask for the latest hurricane coordinates.
(2) Wait for the net control to ask for "any stations in the affected area with weather reports" and then give your call and ask your question.
(3) Wait for net control to ask for "emergency or priority traffic" and then ask.
(4) Disconnect your microphone and listen until you hear the information that you need.

3B:

A massive flood has hit Phoenix, AZ. Your next door neighbor has a favorite nephew somewhere in Arizona and is terribly worried. You should:

(1) Find an emergency net, break in, and ask about your neighbor's nephew.
(2) Find a health and welfare net, break in, and ask about your neighbor's nephew.
(3) Find a ham who regularly handles this sort of traffic, and give it

to him.
(4) Listen to health and welfare nets, wait for them to ask for anyone with traffic for the area, and then give it to him.

3C:
You are listening to a net and someone is jamming it. You should:
(1) Join them in the jamming;
(2) Wait until they stop, and then say "What a LID"
(3) Call the FCC and demand that they stop the jamming.
(4) Ignore the jammer.

I would sure like to see a bunch of questions like this in the question pool!

Will you lighten up? You've been a real crosspatch lately. The 21 mtr frequency was probably an old ISM allocation. I don't remember what it was used for, but I vaguely recall some reference to that in the NPRM when Par 15 was being restructured. Leaky cable proximity detectors, maybe.

As such, I propose that the written exam be divided distinctly into a THEORY exam and REGULATION exam. The REGULATION exam should be given in OPEN BOOK style, using tough questions that require you to look things up. Because most people forget details and trivia anyway, it is better for us to stress the skill of reading the rules instead of memorizing them. In addition we need to also stress the idea of owning a copy of the rules. The VEC's will NOT provide a copy of the rules; you bring your own to the exam. You get to use ONE book or pamphlet during the REGULATION exam.

Perhaps we should ask how many tiers of HF privileges other countries have.

Regional band planning is already going for the larger areas now, especially in California.

Is there a way I can get a message to a particular BBS VIA Info-Hams
AUTOMATICALLY ??
Packet on 20 and 15 meters these days seems to take forever from here but once
in the States - it seems like the messages zip right along.

Please answer via E-Mail (return address) and not via Info-hams.

Maybe the original poster meant that American amateurs aren't very
clever compared to foreign ops? That's one reading of the phrase
"intense density". I could understand it too, considering some of the
blather I've heard on 20 metres lately.

NOTE TO THE HUMOURLESS : THIS IS A TONGUE-IN-CHEEK POSTING. I DON'T

>3. DXpedition/special event slide shows:

Looks like the perfect opening for me to remind everyone about the free slide shows available from the Northern California DX Foundation. To wit:

(last updated 3/15/90)

The Northern California DX Foundation has for loan a number of DX-oriented slide shows. Each program consists of one or two slide trays plus an audio tape with narration, so they make a good ready-to-use program for ham clubs. I'm not going to claim that they're all professional-quality productions, but when was the last time a network news crew offered to spend 10 days on Clipperton? :-)

The rental "fee" is cost of postage only (about $5 roundtrip in the US). Library manager is Josephine (Jo) Clarke, WB6ZUC, 207 Evergreen Drive, Kentfield, CA 94904. If you'd like to order a show, please send her the name of your club, the date for which you need the slides, and more than one choice of program in case your first choice isn't available for that time. The shows are quite popular, so you should write at least a couple of months in advance.

Here's the current list:

SLIDE SHOWS

1. Kingman Reef and Palmyra Island 1974
2. Africa (K5YY) 1978
3. Easter, Galapagos, San Andreas, etc. (W6KG, W6QL)

Can anyone give me some feedback as to what speeds data transfer is
achieving these days over:
a. Conventional Telephone lines
b. Leased data lines
c. RF (mainly microwave)

Is anyone doing some experiments out there digitizing voice and then
transferring it at high speeds via RF ???
Maybe the day 'aint so far off when repeater clubs will have a microwave
dish at their site pointed at OSCAR 'XX' that will forward
voice messages at 56 mbyte per second.

73 de 4X1DA
Richard Harel

Feedback ???

Just that 2^15 = 32768.... Here's a wild guess but I'd say the 15th bit
going between your keyboard and the PLL/Display circuitry was stuck as
logic "1" causing you a bunch of grief. I don't have any clues/solutions
other than reseating the connectors between the keyboard subassy and the
rest of the radio. Never heard of this problem before.

While some companies may do this, DAK refunds both the cost and the
shipping charges if you return the product. You pay return shipping to
DAK, but that's always less than they charge you for some reason.

>| catv = community access television (not "cable tv")
>I think if you go back to ancient times, you will find that it stands
>for "community ANTENNA television".

Right. As opposed to "MATV" which is "Master-antenna television", when an apartment house or ^ other multiple-dwelling unit had their own antenna farm, distribution amps & splitters, and internal cabling to each unit.

In the industry, "catv" is now used to refer to cable tv generically. If you are buying broadband LAN cable and splitters, say, you look at "catv catalogs" for that stuff.

Anybody using the term to mean "community access" probably works in that activity, and such usage is limited in scope and would not be recognized in the general video industry. If THAT is what this proposed USENET newsgroup is to discuss, the name should be rec.arts.tv.community or something specific like that. (I thought of suggesting "rec.arts.tv.commun" but figured that would be interpreted as "communist tv"... :-)

Actually, I disagree with the whole concept of finer and yet finer distinctions and splitting topics up into more and more specific newsgroups. I believe that each newsgroup should have a rather broad charter, and each one be fully two-way gatewayed into an Internet mailing list, the way rec.video interacts with Videotech@wsmr-simtel20. All TV and video technically-oriented stuff should go into that list, and all content and programming-oriented stuff should go into a "rec.tv" or "rec.tvprog" which should have a corresponding mailing list for non-USENET participants. [I don't know what current tv newsgroups there are, not having USENET access myself currently.] Only with that approach can you maximize the number of participants and avoid losing information.

This approach helps avoid the possibility of newsgroup access being cut off by an organization as "non-work-related" (the academics out there don't consider this, but it is a very real consideration at non-school sites!), because it is easier to defend a group as having valuable content that just happens to also contain frivolous (and therefore enjoyable! :-) related postings. Broad-spectrum groups can get in when specific narrow-interest ones cannot. [Actually, "rec.video" should become "sci.video" under this approach, to get it into places that embargo the "rec" groups. Or maybe there should be a "tech" top-level heading for things that are sort of "engineering" -- not pure science but more technical than recreational.]

Anyone who is interested in one aspect of video technicalities, or in one aspect of TV programming or content, really should be at least somewhat interested in all other aspects of that field, and, for their own good (<-- dangerous concept, this! :-), should be exposed to the whole range of topics in that field. The arguments for specific narrow-interest newsgroups thus are specious and should not be given weight. The entire idea of isolating topics and limiting that is inherent in the move to ever-more-specific newsgroups is wrong. It encourages narrow-mindedness, when the whole concept behind the net (in all its forms and extensions) is to *broaden* ones exposure and knowledge base. Too many times, I have seen complaints from people about "having to wade thru too many postings" on other subjects in order to get some specific topic or subject. This is NOT a valid complaint. It is a *benefit* for there to be a sea of knowledge out there that you dip into. Just because you cannot drink it all down is no reason to gripe about it being there!

Since I cannot post it over there, someone on USENET feel free to repost this whereever in the "news.xxx" groups the discussion is taking place. I hope the net.wizards out there will recognize the validity of this point of view and take steps to reduce or eliminate newsgroup subdivision, and, hopefully, do all they can to encourage the existence of gatewayed mailing lists for all groups, so as to insure participation is available to as many people as possible.

Regards, Will Martin

Well, isn't that a strong argument against the name? It certainly isn't
clear what catv is from looking at the name. I would suggest coming up
with a different name (e.g. rec.arts.tv.community if the group is about
community access TV and rec.arts.tv.cable if the group is about cable
TV?).

Also, please don't limit your distribution unless the distribution of the
group will also be limited. If it wasn't for the fact that we get articles
with usa distribution passed on to us, we would have missed out on this
discussion. Of course, if the topic is Cable TV, then it may be a good
idea to limit distribution since it is so much different down there :-).

Several people have asked me to elucidate a bit on this topic as a follow-on to my posting a couple of weeks ago.

What we're talking about here is relatively long-distance reception on commercial TV and FM frequencies at basically unpredictable times and from unpredictable places.

The mechanism is the ionosphere when the E-layer gets excessively ionized and causes skip not unlike the F-layer skips to which we are accustomed in ham radio and normal shortwave. Thus frequencies up to 50, 60, 70, 80, even over 100 MHz are reflected back to earth. In fact this last summer, a 220 MHz E-skip QSO was verified over a few hundred miles, but that is a rare exception.

The most common E-skip reception is on channel 2 (the lowest frequency) from about 1000 miles away. Here in Southern California, frequent "visitors" on channel 2 are from Midland, Texas and Denver, Colorado, for example. My personal reception records distance wise are Saskatchewan to the North and Mexico City to the South.

If the E-skip is really strong, it will be in effect up through channel 6 and even into the FM band. And some hams see E-skip on 2 meters on occasion.

We are at a sunspot peak, and the E-skip conditions are especially good right now. The peak months are June and July, and I'd expect to see something almost every day this Summer.

So what does it take? The primary asset is living somewhere that channels 2 thru 6 are essentially devoid of local signals. Well, that doesn't apply in many areas (California's San Joaquin Valley is Nirvana for TV DX). But here in San Diego, for example, channel 3 is vacant and I can steer a rotary TV antenna away from LA enough to pull E-skip signals out on channel 2, 4, and 5 if they're strong enough. No special equipment required--you can sometimes receive distant TV stations with rabbit ears! By extension, these comments apply to the FM band as well.

Someone asked about publications. Many moons ago (1960 plus/minus) I subscribed to a magazine called "TV DXing Horizons" which was published in Modesto, CA. I'm sure it's long gone, but there is a group called something like the TV-FM DXing Society, and I think several people on the net belong. I'm sure they publish a newsletter, station lists, etc.

A handy piece of reference material is a list of TV stations around the country. Until recently the best source was the "North American Radio and TV Station Guide," a Sams book authored by Vane Jones. But it hasn't been republished in several years and is terribly out of date. (Does anyone know why? Is Vane dead?) But at least the most recent edition will tell you what cities have channel 2s and that's a good place to start.

This might be a good forum to compare reception notes this Summer. Three of us did that informally last year with our own mini-Net, and on days when reception is good out here, it generally is good throughout the country. In fact, on days when TV E-skip is "in," check out 10 meters for some places you don't normally work on 10 (i.e. relatively close by), 6 meters for almost anything, and 2 meters for unusual repeaters.

TV stations are quite good about QSLing DX receptions, by the way. I have cards or letters from 20 states, 3 Canadian provinces, and Mexico that I've accumulated over the years.

So, good DXing to us all.

--Jim, K6ZH

P.S. Rarely does only one station come in at a time. The result is noisy, blurry, color fading in and out, sound from one station over a picture from another, etc. If there's someone in your household who isn't too fond of listening to radio interference, TV DX will drive 'em nutz!!

[NOTE: Message modified, 15 Mar 90 11:47:54]
I have had a number of replies and suggestion about how to create a fair DX contest. However most of these have been through private mail. Maybe if we could open up this discussion for all to see we might be able to generate enuff ideas to get the momentum to have one of the large ARS organizations pay attention and actually formally sponsor a "FAIR INTERNATIONAL DX CONTEST" which anyone in any

location with any equipment would have a shot at winning. Let's not forget that
there is no doubt that unless the

operator is competent and competitive no matter the location or equipment there
will be no chance of winning. All suggestions and discussion welcome.

From personal experience with a CB and magnetic mount antenna, I would recommend
getting a CB with microphone mounted channel controls. It is very convenient
while driving. I would also get a CB with an analog noise limiter(ANL). Radio
Shack carries such a CB, but it is around $100 regular price. I have a Midland
CB(don't remember the model number) with the above specs. I would recommend
a K40 antenna above any other. The fiberglass cover one is nice, since it won't
rust.

Yet another request for info please....

I am putting up a used (got a DEAL) TA-33 tri-band beam but did not get any paperwork with it. I am looking for any information on the assembly instructions, element spacing, etc. I hate to work in the dark. This is a Mosley TA-33M three element 14' boom for 10/15/20.

Thanks very much, de km4jn

Anyone have any idea how I might locate the following folks? I would dearly love to get QSL's for these qso's that I made in the 60's

KZ5CU, Joe in Ft. Clayton, Canal Zone, worked Nov. 13, 1964 on 14.070 cw at 1703
CR6GS, Henry in Nova Lisboa, Angola, worked March 6, 1965 on 21.090 cw at 1327

Any help would be greatly appreciated.

73,
Mike

I'd recommend W4MPY out of Monetta, South Carolina. He advertises in QST every month so you can get the address there. I have done business with them, and they produce a very nice card for a VERY reasonable price. They can do customs or you can pick from a number of standard designs. They will also send you samples, pricing and an order form for the asking. Also, they rarely charge for extras such as logos or awards, which a lot of the others have a fee to include in your design. Give 'em a try- you won't be sorry, but if you are, they'll refund your money.

I have no affiliation with QSLs by W4MPY other than as a satisfied customer.

Check Gail's QSLs in Missouri. They're *vrey* inexpensive and do the job...
 Don't be looking for exotic graphics or neat little pictures, though.
Their QSLs are simple and useful...

Hello,

I own two j-pole antennas, one for 2 meters and on for 440 Mhz.
Does anyone know if there is a simple way to hook them up
to one feed line (i.e. present the appearance of
a 50 ohm, dual-band antenna to my dual-band transiever)?

Thanks,

Jonathan Neher

+>
+Just that 2^15 = 32768.... Here's a wild guess but I'd say the 15th bit
+going between your keyboard and the PLL/Display circuitry was stuck as
+logic "1" causing you a bunch of grief.

I agree that it has something to do with 2^15, but it is not the PLL/Display. Data is sent via a serial to the display and to the PLL's. Keyboard inputs generate scan codes which are read by the u-proc and converted to serial words for the PLL and display, and are also converted to parallel 8 bit data and stored in memory as 4 bytes which hold the value of the 1st mixer freq and 2nd mixer freq.

I suspect a glitch in the u-proc programming. Pressing the reset button recessed on the back should re-initialize the unit. YOU WILL CLEAR ALL CHANNEL MEMORY WHEN YOU DO THIS.

If this doesn't fix the problem, you could e-mail me several examples of the freq you put in, and what it put out, and I could calculate the 1st and 2nd mixer divide values to see what is common.

good luck.

> The schematic seems to indicate that D6 is only there in the Italian version
> of the IC-2SAT. Does the Italian version offer the 108-136 band by default?

The Italian version of the IC-2GAT offers full band transmit out of the box, so this is a fairly safe assumption. Got your passport?

I suspect either the regulations or the enforcement in Italy are very lenient in this area.

> Where does one get this diode?

You don't have to use a chip diode, **IF** you can find a place to put an
ordinary "big" one in. You can get chip diodes from dealers like DIGIKEY
(call 1-800-DIGIKEY). Many chip diodes come in 3 or 4 terminal chips that
have many combinations of diodes in and out. Be sure you are getting the
correct one for what mod you are applying.

NO!! I agree with the Webster's definition.

What I am saying is that we are actually TREATING privileges as DIFFERENT
than the Webster's definition.

> of the word changes, I guess we'll all have to live with it, or quit calling
> our amateur activities privileges and call them something else.
> In my opinion, I think "privileges", as defined by the dictionary, fits the

We agree on the definition, but we disagree on whether the current activity
meets this definition. You say it does and I say it does not.

I believe we should make it match the definition.

> a 50 ohm, dual-band antenna to my dual-band transiever)?

If your two antennas present an INFINITE impedence at the T point on the opposite frequency, then you can directly connect them. However this is very unlikely.

What you need is a duplexer at the antenna. This device splits the RF based on freqeuncy. Larsen and Diamond make them and others probably do as well. Any dealer worth their salt carries one of these.

If your dual-band radio has ONE RF connection, then it has an internal duplexer. An example is the ICOM IC-3210. If not, then you will need another duplexer at the radio end. Certainly you need this if you are using a pair of single band radios.

Typical duplexer costs are in the $50 ballpark.

I learned the code starting at 5 then 10 then 15 then 25 then later 55.
By learning it in steps I don't have trouble copying even the slowest of signals.

I have taught it both ways. I prefer the steps, but it takes longer. If you learn it listening to fast characters spaced out slow, you will have trouble copying slow code.

We have had numerous lockups. Must energize the software reset code to reset the controller. We have a clandestine call sign that shows up as WB6AAX (or similar, think it's the guy at ACC). A bug fixed in V3.41 was not being able to voice over-ride a list of mail box msgs. So in V3.42, ACC tried to fix it and now trying to voice over-ride (key-up during listing), the controller switches to CW call signs. We also have the word 'safe' showing up in call slot 33 even thou it is programmed with a valid call sign. This is intermitent. Ok, that's some of the buggers I've found. There's more less apperent bugs, I'll dig them up and post them soon. Also, the ACC notes used to be great reading. Now, seldom published, the notes are more or less a quarterly broshure of ACC products, kinda like to 'cutesey DAK catalog. But ,at least, ACC went to the trouble,time,expense to publish a good newsletter in the beginning.

So much for the bitchin'. The 850 is still, as afar as personal experience, the finest repeater controller available. I wish our club had the money to buy the DVR, computer interface, IC-900 interface, and all the other available options. But, alass, bongo dollars. Hence the desire for a more afordable controller with the same abilities on a PC based system. Any ideas?

I have been out of RC'ing for about 8 years now, but my gear is still
crystalled up on 6 meters. At that time the standard frequencies were:

53.1, 53.2, 53.3, 53.4 and 53.5

No doubt this has all changed..

I have a Fujitsu Ten 450-470 commercial tranceiver (model # FTM40-3092H). This is
a 16 channel scanning synthesized mobile radio.

I'm looking for a way to be able to program the radio down into the ham band. It
currently on 453 Mhz. I have the programming prom for the radio and, of

course, it will not allow entry of freqs below 450. I called Fujitsu and you can guess what their response was after they figured out that I had a programming prom. So here I am. This is a nice radio and I only have limited use of it in the commercial segment. If anyone knows any way to get around the programming restriction, I'd appreciate any responses.

A transformer is designed so that the voltage on the secondary does not drop appreciably under load. This requires the use of an iron core to reduce leakage. The number of windings in the primary is determined by the size and type of the core as well as the frequency involved (60 hz on the main). As a general rule, small tranformers have about 8 turns per volt on a 1 inch square cross section core per volt and a magnetic path of 10 inches or so. Of course the turn ratio will be whatever is desired by matching impedances to the load.

The code is specifcally required for HF operation by amateurs - not land
mobile, which is what CB is technically.

Or maybe one of those anti-aircraft barrage ballons that look like a miniature
diribible. It's pointy and has tail fins. It would tag along behind a moving
boat like a well trained puppy.

Since 1968 when incentive licensing went into effect, the number of new amateurs as a percentage of the increase of general population has declined every year except one. From 1946 until 1968 the number of new amateurs was increasing faster than the rate of general population growth. From 1968 to 1972 over a dozen old line American amateur radio equipment manufacturers went out of business. Since I was there (first licensed in 1963), my opinion is that incentive licensing is directly responsible for halting the growth of amateur radio in this country. Like many of my peers who held the General class license (which was THE license and conferred ALL privledges before 1968), I found other things to occupy my limited spare time than amateur radio after I was told I had to take two more tests to get BACK what I had already earned. The advent of packet and satellites finally caused me to grit my teeth and upgrade. In my opinion there should be ONE class of license; AMATEUR. Paper chasing, whether it be DXCC or INCENTIVE licensing, is a disease and the cause of most of the problems in amateur radio, and perhaps in American society in general.

...

i have an h.p. "harrison 6206b" dc power supply. works great!
unfortunately, i have no documentation on it. there seem to be
lots of jumper selectable options -- but without info...

btw, this is a 0-60 volt 1.2 amp supply manufactured, i'd guess,
in the early 1970's.

any info would be greatly appreciated. naturally, i'm willing to
pay any copy and/or mailing costs. thanks guys...

Marvin's server (and probably any server that got its data from Rusty) is
updated once a year around October. More frequent updates are not possible
due to lack of financial support.

QEX - The ARRL Experimenter's Exchange - March 1990
Gateway Column

Conducted by: Stan Horzepa, WA1LOU

PROTOTYPE 905-MHZ DIGITAL RADIO COMPLETED

The first prototype 905-MHz "user" digital radio has been completed. The intent of the prototype phase was to arrive at a reproducible design using readily available components which could provide good performance at low to moderate cost. These radios are intended to provide moderate speed, 250 to 500 kbit/s, user access to an Amateur Radio network.

The prototype radio consists of four boards, PA, LO, RX and TX, mounted on a U-shaped chassis. This modularity was used to facilitate design; the pilot run design will be more integrated. The present effort involves laying out two PC boards, one for the PA and another containing the entire low-power radio, power and control circuits. It all appears to fit in a 5- x 7-inch enclosure with a top consisting entirely of a heat sink. Interface to the radio is differential ECL: TXD, RXD, RTS, DCD and S-meter output, antenna connecor and 12 V dc @ 0.3A on receive and under 4A on transmit.

An attempt was made to produce local oscillator signals of good signal purity and stability. This was thought to be important since similar radios will probably be used in the near term at backbone IP switch sites and will need to operate in congested RF environments. There has also been some thought given to full- duplex operation of this hardware, but such operation is not being considered at this time. Dual outputs of +10 dB at approximately 96 MHz and 764 MHz are provided for transmitter and receiver mixing. Both output frequencies are derived from a single crystal oscillator. Spurious signals are below -80 dB.

Transmitter output power is in excess of +41 dB (12 watts) with modulation related sidebands down at least 70 dB (at 250 kbauds, modulation index equal to 1.4) at the edges of a 2-MHz wide, 905-MHz centered channel with out of band spurious performance also over 70 dB down (this excludes the second harmonic which is approximately -60 dB). Suppression of adjacent-channel interference is achieved by control of the deviation and an active filter ahead of the VCO tuning input. The VCO is presently free running at 45 MHz and doubly converted up to 905 MHz. This provides 905-MHz output frequency stability and accuracy essentially the same as that of the 45-MHz VCO alone. This performance seems acceptable, but alternative plans are being considered for providing complete crystal derived frequency accuracy along withfast transmit start-up and 0.5 Mbaud sorts of modulation, if necessary. The present architecture has the advantage of being easily adapted to transverter operation by a slight change of the crystal frequency and the substitution of a multimode HF transceiver for the 45-MHz VCO and receiver demodulator circuits.

The receiver has good BER down to below -90 dB. Turnaround time is better than expected. Since adding a little design effort to the switching circuits, it is now possible to square-wave modulate the RTS (PTT) line at rates of several kilohertz and generate a clean RF square wave at full power. In between these square-wave 12-watt output pulses, the receiver is able to demodulate a -90 dBm signal applied to the same antenna connector (with a 30-dB power attenuator inserted to protect the signal generator). The receiver is fully alive less than 40 microseconds after the falling edge of RTS. It is truly a "packet radar" and calculations show that with an 8-foot TVRO dish antenna or something similar, the radio should be able t copy its own packets reflecting off a 747 aircraft at a 4 to 10 miles distance. In normal use, the radio should easily be back on receive before the previously transmitted packet has reached a distant node.

The first pilot run is expected to be twelve radios and will undoubtedly reveal some areas where change can improve performance and reduce cost. Some thought is being given to a "one-board" lower power radio which can plug into a PC slot. To reduce cost, such a radio might use the phased-lock of an on- hannel FSKed VCO instead of the dual conversion approach.

PC board design is presently in progress for the pilot run radios. It is anticipated that these will initially be used as backbone/switch radios as well as for user access radios as a part of the prototype Northern California moderate speed IP network now being constructed. Plans have not yet solidified for construction of additional radios, but it is expected that the next design effort will be aimed at providing similar radios for ee digital allocations at 1249, 1251 and 1298 MHz.

by Glenn Elmore, N6GN

TEXNET-TNC 2 FIRMWARE ON THE HORIZON

Some of you may have heard rumors of the effort to transport the TexNet software to TNC 2s, which would support smaller "feeder" networks to link to the larger long-haul backbone networks, among other uses. This effort continues and second beta testing is underway and going very well. No releases are yet available.

MICROSAT SOFTWARE DEVELOPMENT REPORT

Some of you might be wondering what we (Harold Price, NK6K, and Bob McGwier, N4HY) are doing with the MICROSATs and why you can't connect up yet.

The development cycle for these launches was very short. Most of the time available for software development, beyond getting the basic operating system and I/O drivers running, was in writing support code for ground-based hardware heck-out. A fully operational CPU wasn't mated to a fully operational spacecraft until very late in the game. After that, much of the available software time went into qualifying the ROM-based bootloader. Given the short time available, the goals were to:

l) Check out all of the hardware on the ground.

2) Have the best chance possible of getting good telemetry as soon as possible once the spacecraft reached orbit.

This resulted in a limited-feature, but very reliable set of launch support software. This is the sftware that was running when the transmitter-on commands were sent.

Once the satellites were in orbit, several shortcomings in the high-level software loader and the battery management routines were seen. Bob and I have been working to fix these, in addition to commissioning the ground-stations which have never talked to MICROSATs before, and spacecraft which have never talked to the ground before, times 4. Once procedures are worked out, they are documented so that new command stations can be broughton line.

Here is a typical day in the life of Bob and Harold. Each day has been like this since launch (times approximate).

1200-1600 UTC: Bob wakes up, reads the mail from Harold for the previous night's passes, copies the early passes, checks the action of the software loaded last night, reconfigures the spacecraft as required, finishes testing the new command and control software for the next spacecraft, and sends it to Harold.

1500-1800 UTC: Harold wakes up, reads the mail from Bob, gets the new command andcontrol software from Bob, integrates it with the new loader code, and tests it on the spacecraft CPU simulator.

1800-2000 UTC: Harold goes to TRW, starts the upload of the new software to the spacecraft (this is a bit tricky, which is why a new loader is being sent). The TRW ARC crew tapes or copies the other spacecraft in real-time. Harold reviews all of the telemetry for all of the spacecraft.

2200 UTC: Harold sends .EXE, which was partially uploaded to Bob to finish the uploading, sens a list of the diagnostic variables to the WEBERSAT ground-station crew to download on their next orbits or calls them to coordinate the use of uplinks to allow the WEBERSAT ground-station crew to access their experiments.

2200 UTC: Bob prepares and tests the new command and control software for the next spacecraft. Harold works on making the ground upload software distribution. The WEBERSAT ground-station crew tests the final camera code on the software simulator at Weber in preparation for it sending to Harold to run on the hardware simulator.

0100-0400 UTC: Bob completes the upload of the new software, prepares the source code for the next spacecraft for the start of the new cycle, answers fan mail, and calls Harold to confirm that the software is uploaded.

0400-0600 UTC: Harold goes back to TRW, holds his breath, tells the spacecraft to terminate the old program and start the new one, calls Bob to discuss the day, and gets a call from Weber on the diagnostic values. Bob goes to bed.

0600-0800 UTC: Harold and the TRW ARC crew tape or copy the other spacecraft in real-time and review all of the telemetry for all of the spacecraft. Harold puts the status message on Telemail.

1200 UTC: Bob wakes up and starts again.

Coming events: Harold and Bob polish their resumes as the above schedule leaves no time to pick up their pay checks, let alone do work.

Once the basic hardware is checked out and the batteries are in good shape, this frantic schedule will change. And once the loader and command software are tweaked fr the last time, they will be turned over to the production command groups, hopefully by the beginning of February.

The next goal is to load the application software. Weber will be ready to do that in a few days. I have to take a business trip and more development needs to be done, which will delay the uploading of the first user-access software until late February. This will allow time for the final hardware check-out, which will include memory tests on the 8-Mbyte of mass memory, determintion of the channel center frequencies, required uplink power, and the like.

SOFTWARE FOR THE PACKET-RADIO STATION

Lately, a lot of new and updated software for the packet-radio shack has become available. A synopsis of these programs follows.

APLink Version 3.94, the IBM PC AMTOR mailbox/packet-radio BBS software package, fixes a minor bug in the packet-radio log-off routine. The software is available on disk from TAPR.

Atari TCP/IP (KA9Q's NET) has been released by PE1CHL in a new version for the Atari computer. It is available directly from PE1CHL, however, TCP/IP fans in the US can obtain it by sending two double-sided or three single-sided disks, a self-addressed stamped disk mailer and a note stating what you want to Mike Curtis, WD6EHR, 7921 Wilkinson Ave, North Hollywood, CA 91605- 2210.

from Julian Macassey, N6ARE

DOSgate Version 1.13 is now available. This version should be compatible with most TNCs and has been tested with the AEA and Kantronics TNCs. DOSgate is an IBM PC program that allows any remote packet-radio user to connect to and use a PC compatible computer as if the user was sitting in front of the PC (see Gateway, Volume 5, Number 23). To obtain a copy of DOSgate, send a 360-kbyte formatted 5-1/4-inch DOS disk, a self-addressed stamped disk mailer and your request for DOSgate to Rich Bono, NM1D, 7 Redfield Cir, Derry, NH 03038.

DRSI TCP/IP PC-Packet Driver is available in a new version that fixes all of the reported bugs in the earlier releases, nowsupports the NOS version of TCP/IP and marks the first release of the source code for the DRSI drivers. The pexecutables and DRSI driver source files may be downloaded from CompuServe's HamNet (file name: DR_NOS.ZIP) or may be obtained on disk from DRSI, 2965 Range Rd, Clearwater, FL 34625.

G4YFB Packet Mailbox Version 3.24 for the IBM (C and compatibles may be downloaded from CompuServe's HamNet (file name: YFB324.ZIP).

G8BPQ Packet Switch Version 3.53 has a number of changes and enhancements including a remote SYSOP feature for etering route/node information, node CTEXT for users accessing the switch via its alias, a BYE command and STATS information.

from Carl R. Finke, WB5DDP, via CompuServe's HamNet

KC8JN PBBS Version 8.21 for the Radio Shack TRS-80 Model I, III or IV (in the III mode) includes reverse-forwarding and BID store-and-forward. It is available by sending three unformatted 5-1/4-inch disks plus $2 (to cover mailing and documentation costs) to Bill Ritchie, N8FIS, 725 Rawson Ae, Fremont, OH 43420. Note that Bill is only able to copy the Model III disks because he does not own a Model I; anyone that wants to run this program on a Model I will have to convert it themselves.

MSYS Version 1.06, the IBM PC and compatible multiuser, multiport PBBS with support for TCP/IP, gateways and packet-radio clusters may be downloaded from CompuServe's HamNet.

PRMBS Version 1.05, the ROSE packet-radio mailbox and server for the IBM PC and compatibles fixes two major problems: the crash- inducing response to a non-standard "Link State is" message generated by a Kantronics KPC-4 and the failure to detect carrier loss of a landline modem connection in the "super-user state." The software may be downloaded from CompuServe's HamNet. The software is also available on disk from TAPR.

W0RLI Mailbox Version 11.8 removes support for MBL3.13, port types AEA and KAM, which is no longer required, and the line "?_name" from config.mb; fixes several cases of mail file corruption when GM. and several different TC hang situations; and adds the V command (like T with FLOW ON). The software's file name is FS1108.EXE and it may be downloaded from N1EDF at 508-949-3590 or WA6RDH at 916-678-1535. The software is also available on disk from TAPR.

WA7MBL PBBS Version 5.13 adds limited support to hierarchical-addressed messages. It may be downloaded from CompuServe's HamNet or via anonymous ftp on Internet from either tomcat.gsfc.nasa.gov (\public\bbs\wa7mbl) or biocat.chem.usu.edu (\pub). Its file name is MBL513.ARC. The software is also available on disk from TAPR.

Packet-Radio Satellite Tracking Programs

The recent launches of amateur packet-radio satellites has generated a lot of interest among packeteers worldwide. In order to use the satellites, it is necessary to know when they will be "visible" to your station. To find out when satellite visibility occurs, the following satellite tracking software is available from the Radio Amateur Satellite Corporation (AMSAT) at PO Box 27, Washington, DC20044, telephone 301-589-6062. Write or call AMSAT for pricing and ordering. Note that the software is discounted for AMSAT members.

"InstantTrack 1.00" for the IBM PC and compatibles was written by Franklin Antonio, N6NKF, and features speed, ease of use, instant visibility, real-time displays, automated orbital element entry and time-setting, satellite and station databases, a 1754 city database, grid square support, satellite co-visibility, squint angle, path loss, real-time rotor control, background moe, sun and moon tracking, fast rise-time finder, multiple station tracking and on-line help.

"Orbits II" is for IBM PCs and compatibles with 256-kbyte of RAM memory, CGA and compatible monitor, one 5-1/4-inch floppy diskette drive and DOS 2.0 or later.

"Orbits III" is functionally equivalent to ORBITS II, but has been designed for use with EGA and an Enhanced Color Display.

"Orbits IV" is the equivalent to ORBITS II, but has been designed for use with VGA.

"N4HY Quiktrak 4.0" is for IBM PCs with DOS 3.0 or later. An 8087 math co-processor is not needed, but the program will run much faster with it. CGA requires 512-kbyte of RAM, while EGA requires 640-kbyte of RAM.

"Quiktrak For IBM" is for IBM PCs without graphics capabilities.

"C-64 Supertrac" for the Commodore C-64, combines N4HY's Quiktrak program and enhanced graphics. It provides sharp, clear and colorful graphics with excellent scheduling flexibility. This program also has the ability to drive commercially available dual-axis rotors. It is available on disk only.

"Apple Quiktrak" is an Apple II menu-driven program for tracking and scheduling of amateur satellites. It incorporates a very fast algorithm for finding usable passes of the satellite of your choice. Satellite pointing angles relative to your QTH and a "window track" mode are included. The window track feature identifies mutual "windows" between your QTH and other specified locations around the world. It includes menu driven utilities fordata entry and requires an 80-column card and 64-kbyte of RAM.

"Satellite Helper," written by W7HR for the Apple Macintosh, provides tabular data output of tracking and scheduling information for up to ten satellites. Graphic displays include rectangular, polar and great circle world maps, and there is a "view" mode which shows the Earth as seen from the satellite at any time. A real-time mode displays data as it changes and is compatible with the KLM/Mirage antenna tracking interface. Data can be displayed on the screen or printed on an Imagewriter printer. A propagation prediction package is also included which calculates the maximum usable frequency (MUF) to any point, sunrise and sunset times, bearings and distances, and displays the gray-line. Satellite Helper requires 1-Mbyte of RAM.

"C-128" is a version of the Orbits program that is written to take advantage of the unique capabilities of the Commodore C-128. It uses time-based incrementing with user-selected increments of time, which results in uniform time increments btween data lines. The program features automatic page formatting and pagination. As many as 20 satellites may be entered into Keplerian files. It requires an 80-column monitor and a Commodore compatible printer.

"Commodore Amiga" is designed for the Amiga operating in 80-column mode. It has the same features as C-128, but runs considerably faster. The program has provision for mode and phase programming to alert you as to which transponder is active. It requires 256-kbyte of RAM.

"Quiktrak for TRS-80 Model 4/TRSDOS 6.0" is the N4HY Quiktrak program modified to run on the TRS-80 Model 4.

"W3IWI Tracking Program" is available for the following computers: Tandy/TRS-80 Color Computer 1, 2 and 3 (cassette or disk); TRS-80 Model 3 (32-kbyte of RAM, one disk drive); Atari 400 and 800 (disk only); Each program provides all of the data needed for tracking satellites, space shuttles, etc in an easily understandable tabular form.

"HP-41 Programmable Calculator Orbit I" will output azimuth and elevation in real-time or all W3IWI arameters in the prediction mode. Special requirements: HP-41C plus QUAD Memory, HP-41CV, HP-41CX; Card Reader is desirable, but not essential.

"HP-41 Programmable Calculator Orbit II" is the same as Orbit I with the addition of functions from the Time Module for output of time and input from the time clock in a real-time mode.

GATEWAY CONTRIBUTIONS

Submissions for publication in Gateway are welcome. You may submit material via the US mail or or electronically, via CompuServe to user ID 70645,247 or via Internet to 70645.247@compuserve.com. Via telephone, your editor can be reached on evenings and weekends at 203-879-1348 and he can switch a modem on line to receive text at 300, 1200 or 2400 bit/s. (Personal messages may be sent to your Gateway editor via packet radio to WA1LOU @ N1DCS or IP address 44.88.0.14.)

The deadline for each installment of Gateway is the tenth day of the month preceding the issue date of QEX.

SB ALL @ ALLUSA $RTDX0903
RTTY DX Notes, 1of3, 3/9/90

RTTY DX Notes for Weekending 9th March 1990.
Part 1 of 3.
BID: $RTDX0903

A point to ponder. This week I received reports of 370 stations; some of them rare DX, some good DX, some just DX, and finally, others who were just normal stations. What does one leave out and what does one use? As you can imagine, the editing pencil had a lot of work to do to keep the notes to a reasonable size. I am not complaining, just indicating that if the stations that you reported do not appear, its a case that for this week there were some rarer stations around. But thanks all the same, and keep up the good work.

Our thanks this week go to BV4VB, I5FLN, JA1BLV, JG1NBG, KT7H, OD5NG, TG9VT, VK2EG, VK2KM, W1DA, W2JGR, W6/G0AZT, W0LHS and the Tri-State DX Association VHF packet cluster. Thanks, chaps for your efforts. They really assist with the work.

RTTY DX Notes, 3of3, 3/9/90

RTTY DX Notes for Weekending 9th March 1990.
Part 3 of 3.
BID: $RTDX1103

ZP6XDW has Box 73, Caacupe, Uruguay.

HH2BZ says to QSL via N1DRS.

ES7JW to Box 73, Viljandi, 202910 USSR.

LY2WW is Gintas Sakenas, Box 2237, Vilnius 232050, Lithuania, USSR.

PJ4V will QSL via WD4JNS.

LQ19DX QSLS via Box 36, CP-1834, Buenos Aires.

V31HQ says to QSL to DL1ZBP.

ZL0AIC says to QSL via HB9AAA.

CE0ZIG says to QSL via NR8J.

GJ4YMX QTH is Box 437, St Helier, Jersey, C.I.

BV4VB will QSL via Box 146, Taichung, 40099 Taiwan.

Notes of Interest:

UA3DK and RW3DX with UA3DZ are reported to be starting activity as 3W3DX, 3W3DK and 3W3DZ after March 13th. QSL 3W3DX to Box 145, Dubna, 141980. 3W3DK and 3W3DZ go to Box 45, Dubna.

Spratley is still on course for 15th March to 30th March, but there appears to be some problem with donations from the U.S.A. It is suggested that you do not make donations until you have consulted with your local foreign assets control office, or whatever it is called in your country. There could be large problems if advice is not received.

OH2BH, Martti, reports that his trip to Aves Island depends on a naval vessel being repaired in time. More later.

The TI9 operation also depends upon a naval vessel being available at the required time, and even so it may only be a 16 hour operation.

VK9NS (Jim Smith) informed me in a phone conversation that all was fine for the A5 (Bhutan) operation in about six weeks, but he is hoping that he can make S2 (Bangaladesh) sometime in the near future before the A5 operation. We will keep in touch.

PJ4V is Saba Island and counts as Saint Maarten.

LQ19DX is a special call for the Argentinian DX Group.

ZL0AIC is in Antarctica.

Lord Howe Island: Well, from reports received, all of which mention SSB and CW, it seems that there will be no RTTY operation. I have tried to contact VK3OT with no success.

XW8KPL states that he will be on RTTY every Saturday and Sunday, but only on 15 meters.

GL DE DX1 (VK2SG) via TG9VT.

Did anyone notice the new allocation for low power transmitters under Part 15 at 13.553 to 13.567 MHz? It is mentioned on page 7 of the March issue of Monitoring Times.

What did the FCC have in mind with this allocation?

Here in Saskatchewan while the provincal ham organization died and most amateurs were fast asleep, our "Devine" goverment changed our ham plates to "vanity plates". We now rate the same as anyone else who wants a personalized plate - pay your $75.00 - you can have anything on your plate. Not hard to see how much our government appreciated our help during emergencies etc.

>remember 300 Mhz split.

I hate to sound like a legal eagle, but what you just described *is* a
repeater, and really shouldn't be in the simplex part of the band. I guess
low power, 1/4 mile range would be ok, but I think things would get
out of hand quickly. (IE: in some areas, there would be one of these on
each simplex "pair". saves the expense of getting a duplexer, also!)

As I understand the intent of the bandplan, repeaters are intentionally excluded
so there will always be freqs for mobile to mobile, etc. I also feel, personally
that high site remote bases should not be parked on simplex freqs with xmit
enabled for the same reason. Leaving rx enabled is fine.

With the cross band *remote base* (not repeater, as the ads say) capability of
the newer radios, It is even more important. Otherwise, some rptr operator
gets a call from an irate simplex user (or, worse freq. coordinator) wanting
to know why his repeater is on a simplex freq. When the smoke clears, they
figure out that some new kenwood/yaesu/icom owner is leaving his dual band
parked in remote base mode. (Usually using his 2mtr handheld to hit a 440
repeater from his house)

This happens regularly in our area. Sometimes even worse scenarios occur,
like when the new radio owner sets his radio for 2 rptrs, rather than
1 rptr & a simplex freq. Instant ping pong once one of the rptr's is kerchunked.

anyway, that's my $47 worth. neat idea though!

I just picked up a used Yaesu FT-2700RH dual band 2m/70cm rig at a hamfest.
It appears that the previous owner has already opened up the coverage from
what the manual says.  I am interested in details of this mod and any other
enhancements for this rig.  Thanks and 73.

About four years ago I bought a Yaesu FT 757 after playing with it, the Kenwood TS 440, and whatever the equivalent ICOM 12V all band receiver HF transceive was. I bought the 757 because it was cheaper, I liked the way it operated, and because it sounded better than the other two. I did a lot of playing with the choices at EEB.

When the radio worked, it was a great radio. In less than two years it died three times: one switching diode went, and the final xsistors blew twice. Ironically, after picking it up from EEB after the third repair, it was stolen from my car.

I have spoken to several local guys who had reliability problems with the 757 and several on the air.

According to the repair tech at EEB, Yaesu came out with the GXII in part to solve some of those problems. The GXII also has a notch filter and a "soft" mode switch, so you can store mode in memory with the frequency. No more hvinf to switch from CW when you want to check WWV.

I'm not sure I would buy a 757 again, but if I did it would definitely be the GXII. One reliable indicator is the relative value of the TS 440 and the FT 757 seen at hamfests. Equivalently aged 757s are selling for $2-300 less than 440s here. The integral antenna tuner represents only a part of that, I think.

I had similar troubles, and worse, with mine.

I resorted to cutting some sections in order to get it to resonate. Mine is ground mounted with 3 radials covering only 90 degrees, since it is in the corner of my yard.

I had an intermittant resonance problem on 80&40 which turned out to be either a bad connection between the trap coil and terminal or dirt in the trap "capacitor", because after runnning full power into it on 80 for a while - it got zapped, and now works! ;-}

Your mixer works! The fact that you have low oscillator injection voltage only affects its conversion GAIN. You might try an auto-transformer or ferrite broadband transformer to step up the voltage, but depending on the particular application you may just leave it alone.

There is a good new ARRL publication about transmission line
transformers (in fact, I think that the title is
"Transmission Line Transformers", but I don't have it here).
I suspect your question is about an RF transformer, not 60Hz
power supply transformer, so forgive me if I'm off base.
This book discusses toroidal transformers and baluns, as well
as other kinds. Probably for best results at most RF (up
to VHF) toroidal transformer is most efficient and is
"self shielding". Amidon, Palomar, Ferritronics, and many
others make these toroidal forms. See also ARRL Handbook
for design info. Choice of form composition and size depend on
both frequency of interest and power level. Good Luck, 73.

I am trying to find out what products exist that demodulate and decode morse code and rtty.

I am working the design of some at home, and while I don't mind re-inventing the wheel in this case (I seem to use CW generators and decoders as a mechanism for learning programming languages and hardware interface), it seems that my latest almost-finished product may fit in some currently unfilled market niche.

Products I am aware of, so don't bother to tell me unless you really want to:
1) The various packet-radio TNCs
2) The CW/RTTY decoder in April 1990 _Radio_Electronics_
3) A cute $180 (or so) decoder with LCD display, advertised in QST and elsewhere

Things I have seen allusions to, so more info would be appreciated:
1) Some packages for (Atari?) computers

My current design has the following features:
1) Small, fits in DB-25 shell (uses surface-mount)
2) Audio input jack (not really a feature, just a requirement)
3) Connects to IBM-PC / clone serial port, port-powered
4) IBM / clone _only_ (uses PC-specific programming)
5) CW only, but this is negotiable. RTTY a different unit for now
6) Adaptave filtering speed and weighting tracking in software
7) Transcript logging to disk
8) Morse generator output for free (rs-232 levels out on jack)
9) *Low Cost* ($49.95 target price)

Any comments on the above? This is not an offer to sell a product, but if you *would* buy one of these, or something similar I would like to hear why (or why not). Should I even consider trying to sell this?

Please Email me, all news feeds to Optilink are currently very flaky.

Thanks for your comments,
-- Paul Elliott, WB6CXC

[crossposted to ham-radio because of possibility of technical discussions, to radio.shortwave because of possibility of including satelite programming, a distant relative to shortwave listening]

I would like to open a discussion period on the possible formation of rec.arts.tv.catv, a group for the discussion of issues pertaining to cable TV. Possible issues include regulation, programming, quality of service and technical issues.

This group would be beneficial in that it would allow non-catv readers to focus on broadcast issues in r.a.tv. It would also allow discussions of non-programming topics not well suited to r.a.tv.

The proposed group is not moderated.

Optionally this group may also include satelite broadcasting, although that is not really cable TV. If they are, perhaps the name should be changed.

This, of course, is not a call for votes. Discussions should take place in news.groups to determine a proposed charter. This discussion should end on April 1. At that time it should be taken to e-mail or a call for votes.

If I've left anything out, I appologise in advance.

Great list, Gary. Now I wonder- has anyone considered putting together a similar list of Six Meter beacons? With the hot conditions to many parts of the world now existing on six, this would be a useful bit of information.

If such a list exists and I don't know about it, please point my punkin head in the right direction and I'll be a happy kid.

Thanks in advance for any help with this.

One program that we(the local Amateur Auxiliary) are putting on
for anyone that is interested is a combo program where we talk
about the Amateur Auxiliary(OO's) and also talk about DF techniques.
The DFing part seems to be a real popular topic. The meetings
seem to run a bit long because there are usually so many
questions.

Try contacting your local OO Co-ordinator(get his name from your
ARRL Section Manager) and maybe he can help you find a
speaker.

*** from Barry Fowler WB6JZL <barry@hprmokg.hp.com>

Simple antenna design (rules of thumb). Specifically, space-saving
antennae since many live in tract houses.

Maybe a t-hunt after the meeting to get the lard butts going.

Pictorials of the "evolution of commercial (and homebrew)" amateur radio rigs.

Maybe a family oriented ham radio campout (something besides ham radio to keep the rest going and not make it as intense as Field Day). Maybe at a nice lake in the summer.

"The world's most simplest xmtr/rcvr and have them come to the next club meeting and compare results".

*** from John Covington WN4BBJ cs00jmc@unccvax.uncc.edu

1. Presentation on proper method of traffic handling
   (we had a local ham do this once; it was very helpful and interesting since with packet many people are now trying to handle traffic that have never bothered with it before)

2. History of Radio Communication
   (a local radio history buff put on a good presentation about the early days of amateur and broadcast radio)

3. DXpedition/special event slide shows:
   (we have had slide shows of St. Maarten dxpedition; a trip to Dayton hamvention, etc.; it gets those who haven't participated in the past a "feel" for how much fun it is)

4. National Weather Service representative:
   (we have a very active SkyWarn group around here; the NWS is much in favor of us and glad to help out. He brought some videotapes of tornadoes taken from a helicopter 0.5 miles away; combined with his discussion of weather phenomena and tracking techniques made for a very interesting meeting).

5. Packet Radio
   (you may already have heard this one; but any kind of specialized communications technique makes for an interesting show if you get someone enthusiastic to do the presentation)

The selection of an enthusiastic speaker can be just as important as the topic. Picking someone who really enjoys what they do will usually give you the best program -- the speaker enjoys the subject, gets an ego boost for being asked to do the program, tries to convey to everyone else how much fun (or important if not necessarily a fun topic) it is, and helps to broaden the horizons of the attendees. Ham Radio is a learning hobby and anything you can do to boost the interests of club members will make for a better club. Some clubs don't have programs (or very good ones) and end up becoming political bitching societies.

Gary Coffman presented some good stats regarding the growth and decline of new Amateur licensees since 1968. These are interesting figures, but I would hesitate to attribute them to incentive licensing. NEW amateurs are hardly affected by I.L., since they generally start at Novice. There are some other reasons that bear directly on the variations in new licenses, among which are:

(1) Perceived cost to get on the air. If a prospective new ham is given the notion that (s)he has to purchase a $500 radio, a $100 antenna, a $150 tuner, a $200 TNC, and a $1000 computer (s)he will probably think twice or three times before going for it, and may be scared off by the economics.

(2) Recreation options. There are more options available now than there were 20 years ago. One such option is computers. A person can buy a computer, join a computer club and have lots of fun---all without having to pass any tests org getting any license from the government.

getting any license from the government!

(3) Observing Hams. I'm sure that a lot of people have been turned off by what they hear today on the bands, in publications, and BBSs. Inexpensive scanners, for instance, let prospective Hams listen in on our hobby in far greater numbers than they did 20 years ago.

I got my Novice ticket during the "1946 to 1968" period Gary mentions. My first station was about as cheap as you could get: an S-38C, a homebrew two-tube crystal-controlled transmitter, and a TV twin-lead doublet antenna. I wasn't a Ham when the NEW incentive license classes were added. Why do I emphasize "new"? Because there was incentive licensing then! My Novice was good for (I think) one year, after which I had to upgrade to General or get out of the hobby! (I got out). I can certainly sympathize with Gary and others who weren't "grandfathered" the privileges they held before the NEW incentive license classes were added. I would have been one of them. But it has little to do with whether an individual choses to become a Ham today.

Gary closes by citing the very reason why I think I.L. works: "The advent of packet and satellites finally caused me to grit my teeth and upgrade". I applaud Gary for that! It is the stuff of which better Hams are made! So, you see, there really is only one class of license: Amateur Radio Operator. A Novice is a Ham just like the Extra; (s)he just doesn't have all the privileges yet.

I would be interested in hearing comments from users of the Muilti-Mode TU's - PK232, KAM and MFJ 1278 (especially new versions).

How good are they on modes other than Packet? How well do they copy hand sent CW? Is the software from the manufacturers good or what programs do you find work well for you.

Nothing beats a first hand review from a product user!

Get the antenna as far away from the computers as possible and use double-shielded coax or hardline. You may also have to shield the radio and add decoupling to power and control lines.

I'm looking for ideas and thought that maybe you netters could provide some helpful ideas. I'm a student at Purdue University and I need ideas for an electronic project.

Requirements:

1) Approx. 80 hours or less to complete.
2) No more than 2/3 can be premade or kit. The other 1/3 must be built up from the breadboard level.
3) It would be best as a stand alone project, i.e. capable of working by itself or with equipment I own. (NOT an absolute requirement.)

Please E-mail any ideas or parts of ideas that you may have.
Many thanks in advance.

This is international good will? This is communications? Ugh.

...until you decide to run hf packet or rtty in "their" segment...

Sorry, Barry, but I tried it, and I didn't like it.

I agree. This kind of "conversation" is exactly what I want to stay away from. The same exists on SSB on those damned DX nets. That is why I often get on the novice bands. They haven't been screwed up by the contest mentality. Actually, shooting the bull can be lots of fun on either CW, SSB, or Unix for that matter. It all depends upon how one initiates the conversation. If it's "strictly business", the reply will be similar, as in typical conversations.

I just use CW as a means of meeting more friendly people without all of the backbiting and territorialism. 'Works fer me...

Adios,
Barry

I have uploaded two ham radio related files to WSMR-SIMTEL20.ARMY.MIL.
They are:

pd1:<msdos.hamradio>
DXCC104.ARC     DXCC Award logger and lister with statistics

An electronic DXCC Award logbook by OH2DN and OH2BU.  User can
select display from 5 different languages (English, Spanish,
German, Swedish and Finnish).  It also makes statistics about
confirmed/worked countries.

pd1:<msdos.hamradio>
SATRA10.ARC     Satellite tracker for MS-Windows

Satellite tracker with visual display using Microsoft Windows.
Maps can be displayed in two resolutions and Europe can be zoomed.
Also includes an interface to a (home-brew) rotator control.

Regards,   Markku (OH2BQZ)

Wouldn't "rec.tv.cable" give a clearer indication of what the group was about?
Most of the 'rec.arts.tv' series tend to discuss program content, and I would
imagine that the kind of group that is being proposed here would be for
technical bits and bobs.
   Just a thought anyway!

Hello all you Motorola aficionados out there !

In my opinion, with all the features built into the Japanese
HT's these days,unfortunately we still have to treat them too
delicately to enjoy them as much as we ought to.

I'll be looking around this year at Dayton for Saber III's,
Motorola's gem of an HT. (upgrading my MT-500)

A few of these were around last year at Dayton and were
being sold at 700-900 dollars. I hope the price drops this year
like they already did on the once-so-pricey MX's.
If anyone has any comments on the subject and/or has info.
concerning availability at Dayton please contact me via
my return-path address. (Not via the Info-Hams address please).

:

I have to agree that the current hierachy doesn't address today's
technology. It seems very sad, however, that reform is inhibited, not
by the lack of good ideas, but by the FCC's computer.

However, this is probably the best opportunity we have to change the
system. If we don't respond now to the FCC with new and creative
ideas (even within the limitation of their computer), we will have no
one to blame but ourselves as new technology outpaces a very archaic

```
system.

>from their own memories to the computer's. Betcha Seymour Cray could...

Nah. Seymour Cray couldn't count above 8.  All his stuff was octal or base-4.
LOTS of us know how to set the bootstrap code for a 6600, though...  the panel
was organized in octal, not hex.

Thanks to all for the responses to my posting about HF verticals. The hands down winner seems to be the Butternut HF6V, especially for roof mounted applications. Although it's a bit narrow banded on 40 and 80 (what vertical isn't?), it seems to show good SWR across the remaining bands (30-10). Butternut provides an add on kit for the WARC bands, as well as what seems to be a reasonably good radial kit.

There were a couple of comments about it handling significant ice loads with little difficults. This is important when you live at 51 degrees north :-)

A couple of people mentioned the Cushcraft AP8. From the people I've talked to, this antenna works well if you mount it on the ground with radials, but is almost hopeless when roof mounted. (When I called the local ham dealer, he refused to sell one to me when he found out where I was going to put it!)

Another response mentioned the August and December 1983 issues of CQ which contain articles on how to build a (legal) clone of the AV-25.

Out of the nine replies I received, six were for the HF6V. Since I was biased towards this one to begin with, guess what's going on the roof :-)

Thanks (in no particular order) to the following people for
giving me their thoughts on this:

Bill Meahan (WA8TZG), Tad Cook (KT7H), Mark (VE6MGS), Goh Kawai (N6UOK),
Mike Edelman (KE8YY), Chris Kelly (WD5IBS), Mike Harris (KM4UL),
haynes@ucscc.ucsc.edu, George La Belle (WB6YZZ).

I'll let you all know in a couple of weeks how this works out.
(See you Saturday on 10 :-)

There have been a lot of postings to the effect of "we need {the no-code
license | the elimination of incentive licensing | your favorite cure-all}
because all the hams are dying out, there are too few new ones, and
we'll lose everything if we don't."

Yet, the following statement has appeared a couple times, and no one
has complained about it or refuted it:

```
: In order to not get foreign hams mad at us, we probably do need to keep some
: band segments relatively clear of the intense density of US hams.
                                    ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
```

You can't have it both ways, folks.

Either there are too few hams, which means that we cannot have an "intense
density of US hams", or we already have too many, in which case you want
more arbitrary filters to reduce the candidates and fewer applicants.

Will

Our Earth Science Department purchased a Kenwood R-2000 HF receiver and an AldenElectronics 9321 Weather Chart Recorder for reception of radio fax weather pictures. Being the resident ham on the staff of the college they assumed that I would know how to hook the gear up. Unfortunately I have not had much experience with HF yet. I have set up a long wire antenna and can hear some sort of data trasmission on the freqs. that came with the Alden docs. Nonetheless we have never seen anything printed in the fax machine except black lines.

The questions:

-- Is there a better way to receive weather pictures with different gear? Is there a TNC and PC setup that might work better than the paper based fax unit?

-- What should the receiver bet set on? (AM, USB, LSB, CW)

-- Is a long wire good enough or do we need a beam or something?

Any assistance or help would be greatly appreciated. Earth Science won't let me walk down their hall until I get this thing working.

What you are hearing is a CHIRPSOUNDER. This is a highly sophisticated device used by the military for plotting real time ionospheric conditions, for the determination of MUF and LUF. These devices (there are several of them) operate in the manner described, sweeping from about 3khz to 30khz at a uniform rate, and a transmitter and receiver plot the spectrum characteristics over a number of global paths, and the display (so I have been told) is a very beautiful on screen representation of the current condition of the entire radio spectrum. Too bad this info is not available to the general public (Oh if only I could provide this on our system here!)... BUT it is a pretty hush hush deal.

There are other noises you will hear in ham bands and elsewhere that first appear to be random, but are actually military in origin (Spread spectrum, etc). There are digital "buzzes" which are used with radio navigation, and these can pop up anywhere, EVEN IN THE HAM BANDS. There is also a very strange sound that I call a "Pock-a-pock" which sounds sort of like someone hitting a microphone with a pencil, but upon careful listening the seemingly random patterns are repeated (I noticed this by accident while playing a recording while simultaneously receiving the signal again live, and found that the pattern was repeated) In addition to hearing these sounds regularly for YEARS on my nightly operating frequency of 3950khz, they also show up on MILITARY channels like 6761, and you can bet your binaries that if this was some sort of pirate activity, it would not have lasted long THERE. These sounds have been around for YEARS. The fact that they are seemingly random leads operators to believe that they are local in origin, but in reality they are heard almost world wide.

There is also an obnoxious signal on 3922 in the 75m band, which reportedly originates in CUBA. It is hand keyed gibberish CW, and it splatters all up the band. It has wiped out communication on 3950, where a "negative spur" shows up during the transmissions. (When the transmitter is UNKEYED, it puts this terrible NOISE on 3950).

I wonder whatever happened to INTRUDER WATCH. Of course, if your own government is responsible for the interference, I guess they have first "dibs" on the spectrum, eh?

Lots of strange signals out there in the wee hours. Join us on 3950 some morning around 1 or 2am and listen, you will hear this stuff. I imagine it shows up elsewhere as well....

Does anyone know a a better way to use the sat feature on the Kenwood ts-790 than to constantly press the sat button, when you want to change the sub rx frequency to the corresponding uplink on the main. I really was hoping that the sat function would do the inverse of what the function 'trace' does, in other words, it would simultaneously change the sub frequency, when you rotate the main vfo knob. Can this be done? In my opinion, the info on this point in the manual is inadequate.

Greetings!

I am looking for the modification information for the new Kenwood 631A/731A Dual-Banders.

Please post as I know of at least three others who are also looking for this information.

Thanks in advance.

>In previous articles
>>>... poor contest operators ...
>>>... about 5 contacts, during which he never said his call.

The worst case I ever heard was a certain 9Q5 station a year or two ago. He refused to give his call after many QSOs. One big gun station worked him and asked for his call. The 9Q5 said he *just* gave his call 5 minutes ago and would do so again in 10 more minutes!

A couple of people commented that some DX stations don't ID to keep the pileups down. I think KH6BZF (Bloomin' Zipper Flipper) has the best way to handle that. Lee turns down his power when the pileup gets too big. Fewer stations can copy him, thus few call. Keeps QRM down all around.

My policy on stations who don't ID after several contacts: He is wasting your time making you wait. I will work him again and ask for his call. If its a dupe I'm not sorry I wasted his time.

I also keep a band activity sheet during slower times (Sunday afternoon). I write down the frequency and call of the guys who don't ID frequently. Later if I tune across him again I don't waste time trying to figure out who he is a second time.

Time to get back on HF ... I'm looking for a vertical that will cover

80 - 10 metres, including the WARC bands. The antenna will be roof mounted on a fourplex, so I have quite a bit of room to play around with radials. It doesn't have to handle full power, since the rig only pumps out 150 watts or so. Coverage of the 160 metre band would be nice, but it's not mandatory.

Please email and I'll summarize.

The Carnegie Tech ARC (W3VC) plans to buy a 440 MHz preamp soon and would appreciate any recommendations, pointers to good review articles, and/or any "Horror Stories". The preamp will be used for SSB, ATV, and satellite work. Thanks and 73.

It seems we are getting lots of alternative ideas on new license classes and examination strategies. These ideas I have seen fail to address many issues and are essentially worthless in their limited scope. Therefore I want to bring up some of the issues so that if you get some ideas, you can work on making your idea address the issues (even if the idea is why the issue is not important).

I do in fact like to read other ideas, but I don't get much out of them if they are incomplete.

What is a codeless license class for?

In general it is to provide for a means for people who want to operate only certain subsets of amateur radio activities to be able to do so without having to learn morse code. If you believe that one should learn morse code for these particular activities, please say so and why you believe so. If you have an alternative licensing idea, please include a means to allow these people access to these activities (or explain why they should not have access).

1. microwave experimentation
2. high speed radio networking
3. general packet radio
4. ATV experimenting
5. voice repeater systems and networking
6. public service radio operation VHF/UHF

By no means is the above list complete, but an idea leaving out any of these is also incomplete.

>is not as accurate)..

Uh, what's the problem?  You *do* have a dummy load that will take
your transmitter's full power, right?  Use that as the input resistor
for your attenuator: something like

         2.2K (or whatever)
Input---+-------v^v^v^----------+------------ Output
     |             |
     > 50 ohm      > 50 ohms

> 440 band and output on 144 or 220 band, or visa versa.

As one who has read the CURRENT rules over many times, I personally would
not hesitate to put up and operate such a repeater, provided I can do so
without causing intereference to any other communications, and had the
```

equipment to do it.

I would NOT put up a remotely controlled phone patch (not part of a repeater and thus not under automatic control) with INPUT BELOW 220.5 Mhz (or on the 431-433 or 435-438 Mhz subbands). I am giving serious thought to putting one up on something like 446.475 in and 146.475 out, which would be full duplex, and in fact fitting the local band plan simplex channelling with an easy to remember 300 Mhz split.

International regs require knowledge of code for INTERNATIONAL communications pivileges, NOT for operations below 30 MHz. Witness the dreaded CB'ers. They operate below 30 MHz (some of them legally) and are not required to pass a code test. There really isn't any reason a new class license couldn't be given a low power HF limit (or high power for that matter) and restricted to US contacts only below 30 MHz.

Of course, the ideal solution would be to bring back the canned FCC code tests and anyone who wanted to could memorize the QSOs just like you memorize the question pool.

Does anyone know of any public domain/freeware/shareware morse programs for the mac? (I have an SE, 2.5 Meg of RAM, single floppy+HD system). It must be able to Farnsworth, and xmit a user entered message (we plan on using it to give tests). Random messages a strong plus. Being on macserve@pucc or avaialable to a lonely bitnet site also a strong plus. Thanks in advance.

With all the talk about code vs. no-code, no one has stated the REAL reason to learn morse. To know what they are saying in old war movies! (if anything). On a side note, anybody copy anything in The Hunt for Red October? "My morse is so rusty I could be sending the measurements of the latest centerfold"--The capt. of the Dallas (I think).

I bought a audio spectrum analyzer/equalizer a couple years ago. It was termed a final close-out then and it's still being sold. But I'm satisfied with the merchandise and would purchase again if I found something appealling. I don't much like the cutsey catalog and I deplore the Shipping/handling charge which seems to have no rhyme or reason with respect to actual shipping charges incurred by DAK. I would just as soon see the listed price include the handling (a rather normal cost of mail order business) and the shipping charges could be imbedding the price also. Any premium shipping methods could be surcharged. Gosh, I feel a little better now.

Well, my suggestion would be: hide your microphone. Work a LOT of CW. This way, you practice your code and have fun at the same time!

Obviously, your mileage will vary. But if only I had had a big enough ego to study for the Extra written exam, I could have gone from Novice to Extra in four months, instead of just to Advanced...

Periodically, there have been postings by contesters here. I put together a writeup for the Potomac Valley Radio Club bulletin on how to access stuff on the net and there was a lot of interest in E Mail to other contesters. I including a few addresses I knew, such as KM3T, WN4KKN, K1EA.

I was asked by several PVRCers to put together a more comprehensive list. If any contesters out there are interested, send me some E-Mail direct and I will compile the addresses and send the distribution file back out. Big gun, little gun, pop gun, top gun, whatever, if you're interested or active in contesting send your net address to PESCATORE_JT%NCSD@GTE.COM and some time in the distant future I'll compile them.

P.S. My comment on the stations who run a pileup without identifying: I listen for three contacts, then work them. If it is a dupe we both wasted time. K3NA calls it the "crow threshold": you should identify whenever the sounds of "call! call!" rise above the crowd. However, a lot of people start caw-ing without listening AT ALL.

In the ARRL contest some DX stations were smart and used an odd-ball power for the exchange, which made it easy to ID the station without the call. I always knew it was TI2DU when I heard him send 59 900. In the CQ contests, the zone helps a little but not as much.

Just a few comments on the subject of DX stations identifying or not identifying after every QSO. As a "little gun" DXer who has always operated barefoot, and intends to keep doing so, I have learned that listening more than talking results in less frustration and more satisfaction. Yes, it is somewhat frustrating to hear a large pileup and not be able to immediately identify the station at the other end. However, all DX stations do identify periodically. If you are a big gun who has to get in and out immediately, so be it. I have found that if I listen a few minutes I will find out who the station is and usually the QSL information without cluttering up the frequency by asking "Who is this station, where is it, what's your call?", etc.

Some DX stations are more proficient at identifying at short intervals and providing QSL information than others. But if you REALLY NEED the country it is worth a little listening. Good operating procedures do work for chasing DX; listen and make your call when you know the other station can hear you and keep it short. I have heard countless DX stations come back to stations who keep calling and calling and never listen so never hear the DX station calling them.

Use your ears more than your mouth and you may be surprised how many DX contacts you might be able to make.

"Forgiving" presupposes that the forgivee has done harm. Tell me what's wrong
with incentive licensing....or incentive anything else for that matter. While
there are those who obviously don't like the League, this shouldn't be taken
as evidence that it is the Evil Empire.

I'm looking for some advice on running a ICOM-735 from my sailboat. A good attena idea is what I need. I know many folks use insulated backstays but this mod looks expensive. I have the 3m mobile whip that is sold with the radio. Is this likely to work? If so how to ground? Are there better options for HF?

Here in the Willamette valley of Oregon we (three different VE teams) recognized some of these problems that VE's go through. WE asked ourselves how could we change things!   We got together and agreeded (strange word for hams huh?) to hold a VE session once a quarter and then agreeded upon the second saturday of the month. This keeps each team to only having to do a session every 3 months (less chance of burnout) and gives all the hams in the area a scheduled chance of taking a test.

We contacted the local community college and are teaching novice classes each

quarter(the last class just "graduated" 12 novices and 1 tech!). Note that one 12 year old was in the class the rest were > 40!

Can anyone provide me with a schematic and a pin out of IC-315 (CPU) for the Uniden HR/2510?

Would like to do a comparison between my 2600 and the 2510.

Also, if anyone has any info on extending the range of band segment "D" from 29.500 to 29.999 Mhz instead of the factory 29.500 to 29.699, Please drop me a line.

Thank You

Paul Hagar N2FAN   Please use CALLUP for address. Poughkeepsie, N.Y.

P.S. = My HR2600 does not have a potted CPU chip!

> satellite work. Thanks and 73.

AMSAT runs an ongoing competition in order to encourage people to improve their listening set ups with the hope that they will use less transmit power on the uplink (on average of course ;-). What does this have to with preamps? ALL of the recipients of the top category certificates for quite some time have used LANDWEHR's on both 2 meters and 70 cm. They are available from Henry Radio in LA. If you are an AMSAT member, ask for Jack Sommers, WA6VGS. He will cut a few points of the usual retail. I have both of these preamps and am extremely satisfied with them. I have not made an exhaustive comparison, but these are the best I have tried in twenty years of VHF/UHF/satellite work. The intermod performance is outstanding, they are capable of three different types of keyed switching to several hundred watts or RF sense switched to over a hundred watts. I recommend them highly. I have no connection in any way with Henry Radio, Landweher, etc. other than as a satisfied customer.

Bob

I noticed a recent ad for a highr power version of this little gem. You should maybe look into it.

I would be more interested except that 12 years ago I built a transmatch the size of a GE Progress Line containing a couple of Johnson amd Millen capacitors of excessive proportions and all for a price of only double that of an equivelant commercial unit. (blush, I run 40 W) But it was fun.

My local Radio Shack (and maybe yours too) is having a sale on their CB radio. It is the Realistic TRC-418 CB (catalog number 21-1511). Sale price is $49.95, which

is half the regular price of $99.95. No license needed,
extra rugged mic with locking plug (what's a locking plug?)
priority switch for Channel 9 and 19, LED channel display,
5 bar LED signal/power meter, with jacks for PA and external
speakers. They are also selling a magnetic mount CB antenna
(catalog number 21-1006), with a 16 foot prewired connector.
This is a Special Purchase at $15.88.

I am interested in getting one. Is this a:
Good radio?
Good antenna?
Good price?
Any problems/idiosyncracies to be aware of?
Any other recommendations?

Thanks (and 10-4 Good Buddy!) - Ihor
~[:-) couldn't resist that one ;-)

> Does anyone know of any public domain/freeware/shareware morse
> programs for the mac? (I have an SE, 2.5 Meg of RAM, single floppy+HD
> system).

A year ago, another ham gave me a mac disk with programs from Project Mac
(from QST?). It had a variety of programs as part of it. It appears from
a ReadMe file that Stan Hozepa, WA1LOU coordinated it (Stan, you out there?)
I assume my friend pulled it off the net from this group so some others out
there probably could give more info about it. The hypercard application is
what I liked the best that had a variety of applications built into it, one
being a morse code tutor. I use it all the time as I am studying to upgrade
my license.

Stan are you out there or does anyne have an e-mail addr or know more about
Project Mac? I have some questions about it myself.

Oh yeah, BTW, I've been following this code/nocode debate. Just for the record, for one who is studying code to upgrade: I was reading the ARRL general class license manual an they made a comment about station accessories. They said, "There are a number of station accessories that make the difference between simply operating a radio and having a full awareness of the communications medium called Amateur Radio." The philosophy between "simply operating a radio" and understanding Amateur Radio seems to be the difference in the debate that goes on. I don't really care about others but for me, one of the enjoyments of getting into the hobby of Ham Radio is to learn about Ham Radio - which includes morse code. Enough....

Excerpted from the Macintosh ham software list I recently posted:

COLLECTIONS AND MISCELLANY

"Project Mac"
Contest logging, antenna design, satellite tracking, clip art, etc.
Microsoft BASIC required for many (but not all) of the programs.

     Stan Horzepa WA1LOU, 75 Kreger Drive, Wolcott, CT 06716.
Send three formatted 800K Macintosh disks with stamped, self-addressed return disk mailer.

****

However, Stan tells me that virtually all of the Project Mac stuff
plus lots of newer programs are in the MacNet collection, to wit:

****
MacNet
Public-domain programs (currently on nine disks) contributed by
Macintosh packet users. Includes test preparation, contest logging,
propagation prediction, satellite tracking, and amateur television.
     John D. Seney, KB1HE, 144 Pepperidge Dr., Manchester, NH
03103. Send formatted 800K Macintosh disks with stamped, self-addressed return disk mailer. Contributions of public-domain
programs encouraged.
****

>I assume my friend pulled it off the net from this group so some others out
>there probably could give more info about it.

I'm not aware that the Project Mac programs have been posted to Usenet
or are archived on any Internet sites. I'd like to know about the latter
if there are any.

73,
Patty

I have a Yaesu FT-727 dual-bander HT and I have set it up to receive (and transmit) out of band. I did this by resetting the microprocessor and giving it the code 111111 instead of the normal six digit code. The LCD will display from 100-200 MHz and 400-500 MHZ. However, I can only receive signals within about 10 MHz of the ham bands.

I really want to pick up 162.55, etc., and I would like to know if anyone knows how to increase the receive range. I imagine it is an out of range IF problem. Please e-mail replies.

Thanks, Barry Newton

These contests are run by the magazines, right? So if you hear that rare-station-X is violating the rules by not making a complete "exchange", including his callsign, in each contact during a contest, why not write or call the magazine and make a formal protest, asking that they disqualify any contacts with that station and any entry from that station from consideration in figuring the scores of the competitors?

Maybe they'll ignore you, or maybe they will reject your contention, but, if you don't DO that, it doesn't seem you have any right to complain about this conduct. As long as it tacitly or explicitly accepted, and there is no attempt to counteract it, it must be OK and THEN you should begin to press for the written rules to be revised to accord with the reality.

There seem to be enough paths for publicizing such things in the ham radio hobby that it wouldn't be possible for such formal protests to be quietly ignored if you pushed them.

Regards, Will

I have a friend working on a radio transmitter circut that calls for a
"16:1 transformer."

As far as I can tell, it is for a 150 watt circut and these is no further
information on it in the schematics.

Does anyone have construction details for such a RF Transformer? I know
little about it, and just told him I'd ask around, so....

Please mail replies.

Can somebody please post a list of Radio Control frequencies
for the Six Meter Band? I know that the ARRL repeater Directory
Band Plan lists 50.80-50.98 (by 20 KHz) but I also remember
a comment that the ARRL Bandplan does not reflect reality
as recognized by the rest of the country. Please post any
clarification, and thanks.......73 de WD5IBS

It's a safe bet that almost all cable companies do that. After all, they don't
want to be bothered with a zillion telephone complaints about crummy service.

Say what?? Many--I'd bet most--countries certainly do have multiple license classes. To take a few random examples from the DX Callbook:

Spain: 3 classes
Ireland: 1 class
England: 2 classes
France: 4 classes (3 if you don't count the one you get simply by holding the highest license for a certain time)
Ecuador: 2 classes
Lichtenstein: 4 classes
Netherlands: 4 classes
Japan: 5 classes
Italy: 1 class

Granted, few countries have as many classes as we do, but the *concept* of greater privileges as a reward for passing more tests is clearly very popular.

Patty

I think . . .

you need to make sure that at the operating frequency, the reactance of
the unloaded transformer is very high (so little current will be drawn
when the transformer is unloaded).

> I disagree--vehemently. In fact, I can't understand why incentive licensing
> has suddenly started taking such a bashing. I got into amateur radio about

First of all, Incentive Licensing is occupying a LARGE number of the class
slots in the FCC computer. The FCC is making it clear they do not want to
change their computer system. Since Incentive Licensing is taking up a

large number of these slots, those who don't feel it is working are quick to call for its removal. The FCC has also opened up this new can of worms by proposing the deletion of the Novice and Technician classes. Petitions have been for just adding a class, but the issue is getting to be more one of restructuring the entire amateur licensing system.

> 15 months ago only because I wanted to fly my R/C planes on 6 meters. It seemed a little extraneous to have to learn CW in order to get the technician license I needed for my planes, but those were the requirements so I did it.

I did it, too, so we both have a little brown on the nose.

> Somehow I got more involved than I planned, though, and I went straight to extra. Now I spend almost all my time in 7-7.025, 14-14.025, and 21-21.025. That's where most of the DX is, you don't hit too many lids there, and if somebody is poking along at least it's not another American. For my money, incentive licensing IS working. As far as the workload on the VE's is concerned, let the VE's worry about that. I'm more than willing (and I do) to give up a Sunday morning every few weeks to give exams. We have plenty of people in our VEC (the Sunneyvale, Ca. VEC) who are willing to do the same. For those people who are willing to put in the effort to earn the privileges, we're there to help. To hell with the rest. Amateur radio doesn't need them.

If what you want out of incentive licensing is to squeeze most of the hams into a smaller amount of space, then I guess it is working. I recall the ARRL saying something entirely different at the time; something about increasing the competency level (theory AND code) of radio amateurs.

I'm not convinced that we need FIVE different levels (one of them being an EMPTY level, i.e. no HF privs for no code) of HF privs.

If Incentive Licensing is so great, then why don't other countries practice it, too?

In fact, all the I.L. really gets done is create yet another layer of the "haves" and the "have nots".

In order to not get foreign hams mad at us, we probably do need to keep some band segments relatively clear of the intense density of US hams. We can do this in many ways. We can keep TWO or THREE (but NOT FIVE) levels of HF privs and get the same effect. We can ALSO promote VHF/UHF MORE and HF LESS.

Compromise is the name of the game.

Many suggestions have been made and many more are coming. Good ideas are encouraged; ideas that are well thought out and consider all aspects of the problem. Send contributions to the hamlicen@vmd.cso.uiuc.edu mailing list. E-mail to ME for instructions on how to get on the mailing list and discuss actual and realistic ideas.

This is not actually a reply...

I was wondering how you determine just how many winds are needed for a
transmformer.  I'm sure 2 winds and 32 winds of #2 copper wire on an air
core are not going to do well when connected to the 110 volt mains.

==

Notation note: A few days ago I needed to label some inputs on my equipment. Needed to tell inputs from outputs. Needed a clear tag, and I had some of those stickers intended for labeling wires. Spelling "IN" was too messy, and too big. Turns out that the Chinese symbol for "in" looks like a capital "Y" upside-down. So, I used that, by using a "Y" upside-down.

[re-formatted so everyone can read it :-)]

>73's de Syl VE5ZX

Well, I tell you what. I recently downloaded a program (CW311 or something like that) which uses your 'standard' serial port on your PC compatible to control your HF rig. I don't know if it accepts keyer input, but it does accept keyboard input, with a pretty nifty typeahead buffer (I got about 50 characters ahead of the code before I ran out of 'now is the time' text :-)). I've only run it once since I found out that it is designed more for sending code than for practicing it.

In any case, I'll make you (and everyone else here on the net) the following offer:

Send me a FORMATTED MS-DOS disk (3 1/2" 1.44 or 720k, or 5 1/4" 360k or 1.2 meg), or even a DC300 or 600 cartridge (urg! :-)), with return postage, a note saying that you want the code programs I mentioned here, and a self-addressed return label, and I'll put CW311 on it, along with the 2 or 3 other morse programs I've got (SuperMorse and Morse, I think... there may be another one, too). If you send me a 360k disk, and you are more interested in the learning programs than in the sending program, tell me so, since I'm not sure they will all fit on a 360k disk. Also, tell me if you need the PKZIP unarchiver, since thats the format they come in....

If you are using something other than a PC, sorry about that, these are PC (XT/AT, i.e. IBM compatible) programs only...

Oh, yes - an address! What with the weather, you may want to send disks to my P.O box (it is a little more protected from the rain/snow/whatever): Rusty Carruth, P.O. Box 461, Lafayette, CO 80026. But, you can also send it to my home: 1260 Forum Drive,^^^^, CO 80026. (It will be a little faster that way, since I don't always get to the P.O. box every day, but more at risk for water damage!)

If I get deluged with disks, it may take me a while, but I'll try to do my best...

Oh, if you want email acknowledgement of your disk, send me your email address too.

Well, I've not 'done it' yet, I'm currently working on it. I'm listening to a tape while drivingn to and from work (not the whole time, maybe 5 to 15 minutes each way), and I've begun using one of those morse code programs on my AT (confusible, not the 'true blue' stuff :-)). The tape sounds like about 15 wpm chars with 13 wpm spacing, I'm running the program in keyboard copy mode, with chars at 18 wpm, spacing determined by how fast I get the character right (probably not the best way to do it, but I'm having fun anyway). I'm adding 'new' characters in groups according to the way the tape does it (since I never learned D and B solidly, for one thing!). I plan to do some listening to 'the real thing' on HF soon, and I'll probably do some practice writing things on paper to see if I can overcome my writing problem...

> If we knew what we were doing, it wouldn't be research

Ah! I'm researching morse code! :-)

There have been quite a few articles in 'recent' years about how
to make a 'poor man's spectrum analyzer'. most of the articles
(Ham Radio, QST, 73) based the design on the use of a modified
TV tuner. One article (wireless world? hmm, don't remember, sorry)
used a few IC chips, with no help from a TV tuner.

I believe any one of the above could be built for under $100.

Not quite bits of wire and canning jars, but pretty close! :-)

I would also be interested in any other ideas people have (which
is why I posted rather than mailed).

P.S: Perry, since you are so close, and since I've got a "Real
Spectrum Analyzer (TM)" now (not calibrated, however :-( ),
I'd be happy to let you come over and use it. Warning -
it weighs 175 pounds, so you'll have to come down to my house...

Probably one of the most frustrating things about trying to run a net on 10M, in my VERY inexperienced and Humble Opinion! That and being able to hear people 5-9 and having them not even be able to hear you call them back...

>I had the pleasure of one OF explaining to me how all nets get
>closed down for contests. Arrgh!

Boy, I miss out on all the fun! :-)

No apologies needed. I'll try to remember to look for you folks on march 31, also. Probably won't say much, I've been out of school for quite a while...

In any case, good luck with your net! I will say that an hour of calling CQ with no response can be very frustrating, though.

73 to all, and hope to cu on the un-net (today, even! :-))

SpaceNews

MONDAY MARCH 12, 1990

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world on UseNet and Amateur Packet Radio. It is available for UNLIMITED worldwide distribution.

* STS-31 NEWS *

A series of background briefings on the Hubble Space Telescope, the deployment mission, secondary payloads and the astronaut pre-flight press conference for Space Shuttle mission STS-31, now set for launch on April 12, will be held March 15 and 16 at the NASA Goddard Space Flight Center, Greenbelt, Md., and March 19 and 20 at the NASA Johnson Space Center, Houston.

Briefings will be carried live on NASA Select television, available on Satcom F2R, transponder 13 at 3960 MHz. Two-way question and answer capability will be available at other NASA centers and at Headquarters.

During the mission, media wishing to focus attention on the Hubble Space Telescope activities are advised to contact Goddard Public Affairs, 301/286-5565, to arrange for accreditation at the Goddard News Center. Goddard will operate a 24-hour-a-day newsroom during the mission and will have telescope scientists and managers available for briefings and interviews.

[From: Peter E. Yee @ NASA Ames Research Center, Moffett Field, CA]

* UOSAT NEWS *

UO-14 continues to run the FORTH DIARY on the 1802 OBC, using Data formats distributed just after launch. The development, publication and implementation of downlink data formats for OSCARs is a delicate business, especially early in a mission. We do not want to publish data formats if they are likely to change quickly, lest people waste their time implementing software which will later become useless. On the other hand, if we do not publish formats, you cannot listen to the satellites - and that's what they're there for!

In the next month, we will be changing operating regimes on UO-14, as the PACSAT Communications Experiment is brought on line. Once this happens, asynchronous data formats (as used by the DIARY) will give way to synchronous, AX.25 packet formats.

As soon as possible, the PACSAT Communications Experiment on UO-14, and the BBS systems on PACSAT-OSCAR-16 and LUSAT-OSCAR-19 will be brought on line for general use. All three of these satellites will be running the same software, using the same protocols - developed jointly by UoSAT and AMSAT-NA. NK6K and G0/K8KA have already published a standard for a broadcast (e.g. bulletins and whole-orbit-data protocol. A final specification should be distributed soon, and early transmissions from the UO-15 PCE will use this protocol. Specification of the message-transfer protocol is well under way.

Thus, the stable state, which we expect to reach sometime this spring, is that UO-14, PO-16 and LO-19 bulletin boards will be accessible with the same groundstation protocol software. Broadcasts from these satellites (e.g. bulletins and whole-orbit data will also come down in a single standard data format. Until we change this state, groundstation software developers are advised to make their programs modular and be ready to revise!

Downlink Modulation:

UO-15 is capable of transmitting either 1200 bits/second AFSK (as used on all previous UoSATs and currently transmited by UO-15), or 9600 bits/second FSK. Ultimately, the PACSAT Communications Experiment on UO-15 will support only 9600 bps FSK. During the transition from DIARY operations to PCE operations, however, we will also be transmitting AX.25 packets at 1200 bits/second AFSK. Like DOVE, this should be copyable with a standard, unmodified, TNC.

[From G0/K8KA via OSCAR-11]

I have designed an unbalanced mixer (frequncey changer) using 40673 dual_gate

mosfet which I belive needs a voltage level of 1V at it's local oscillator
port

in order to function correctly. The output from my local oscillator is

in the order of 0.4V, but I still get the right frequencey at the output,

can anybody explain please?

thanks in advance,

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Compared to looking out the scratched, yellow and crazed windows of an
ancient Cessna 150 doing a 45 deg. bank, it is a pretty good , cost effective
solution.

Compared to sitting at sea level (literally!) and wondering where the fish are,
it would be great! Besides, it will work better than you think.

Most *big* fish signs are relatively easy to see... just look for the birds
and follow the food chain. most gamefish kill lots of baitfish, which the
birds scavenge. The other items you look for are:

flotsam, floating turtles (I guess they have to rest also!), and weed lines.
Besides providing cover, most weedlines indicate temperature changes in the
water. but this is not alt.fishing.

I am looking for a copy of certain articles published in HAM RADIO.
My local public library does not keep back issues older than 3 years
old but I did manage to find a cumulative index and extract the dates:

Jul 83 p53	Two-band receiver, modular, WA3TFS
Sep 84 p8	Comments, WA3TFS
Nov 84 p57	Two-band receiver, extending the modular, WA3TFS
Feb 85 p67	Linear amplifier, HF, solid-state kilowatt, mobile, WA7SPR

If someone would be kind enough to send me a copy of these articles I
would be very grateful, and would of course reimburse any expenses.
I need these articles for reference in a construction project. BTW, if
anyone has built any of these or otherwise has any experience with them
I would be very interested in hearing your comments. Please post them
as I suspect others on rec.ham-radio would be interested also.

Thank you very much. BTW, e-mail to Locus has been having some problems
recently because we are not yet fully registered on the net, so please use
a full path in any replies. If you can route to UCLA or JPL (elroy) there
should be no problem with mail delivery to lcc. The uunet path to lcc may
not be operational for a while.

**** UoSAT-OSCAR-11 BULLETIN - 208   3rd March 1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

Data Formats

UO-14 continues to run the FORTH DIARY on the 1802 OBC, using Data formats distributed just after launch. The development, publication and implementation of downlink data formats for OSCARs is a delicate business, especially early in a mission. We do not want to publish data formats if they are likely to change quickly, lest people waste their time implementing software which will later become useless. On the other hand, if we do not publish formats, you cannot listen to the satellites - and that's what they're there for!

In the next month, we will be changing operating regimes on UO-14, as the PACSAT Communications Experiment is brought on line. Once this happens, asynchronous data formats (as used by the DIARY) will give way to synchronous, AX.25 packet formats.

As soon as possible, the PACSAT Communications Experiment on UO-14, and the BBS systems on PACSAT-OSCAR-16 and LUSAT-OSCAR-19 will be brought on line for general use. All three of these satellites will be running the same software, using the same protocols - developed jointly by UoSAT and AMSAT-NA. NK6K and G0/K8KA have already published a standard for a broadcast (e.g. bulletins and whole-orbit-data protocol. A final specification should be distributed soon, and early transmissions from the UO-15 PCE will use this protocol. Specification of the message-transfer protocol is well under way.

Thus, the stable state, which we expect to reach sometime this spring, is that UO-14, PO-16 and LO-19 bulletin boards will be accessible with the same groundstation protocol software. Broadcasts from these satellites (e.g. bulletins and whole-orbit data will also come down in a single standard data format. Until we change this state, groundstation software developers are advised to make their programs modular and be ready to revise!

DownlinK Modulation

UO-15 is capable of transmitting either 1200 bits/second AFSK (as used on all previous UoSATs and currently transmited by UO-15), or 9600 bits/second FSK. Ultimately, the PACSAT Commuications Experiment on UO-15 will support only 9600 bps FSK. During the transition from DIARY operations to PCE operations, however, we will also be transmitting AX.25 packets at 1200 bits/second AFSK. Like DOVE, this should be copyable with a standard, unmodified, TNC.

de G0/K8KA.

* UoSAT-OSCAR-15 *

Experiments are under way using a large (150ft) antenna at Stanford (SRI-USA) to attempt to detect very low level signals leaking from the UoSAT-4 on-board uplink receiver local oscillators. If the spacecraft power systems are still functioning, then these signals should always be present since the receivers cannot be switched off. However, these leakage signals are deliberately minimised during the design of the satellite and so they are very weak (-60 dBm = one thousand, millionth of a watt or the equivalent to looking for a single Xmas tree light in Australia!). The experiments at Stanford are therefore very demanding: it will only be possible to extract the signals from the background noise using sophisticated off-line FFT signal processing, and a one second error in antenna tracking time may miss the satellite altogether!

de G3YJO

If anyone still needs a program for the Mac to convert DOVE telemetry hex codes to engineering units, I have one to offer. It's written in FORTRAN (please no flames, I'm of the Baby Boomer generation, a.k.a. FORTRAN generation) and I can supply (via e-mail) source code or the binhexed application, or both. E-mail inquiries to me at the address below. If I get too many requests, I might have to ask some kind soul to put the files on their system so that they can be accessed via anonymous ftp.

In article <37@thoreau.nsc.com> greg@thoreau.nsc.com (Greg Dean) writes:
>ISDN (Integrated Services Digital Network), is a new network protocol
>which aims to handle both voice and data (including X.25).

ISDN is much too litle and far too late (IMHO). I want a few 10Mb/sec lines coming into my house.

Recently I saw Dr. Robert W. Lucky here at USC. Dr. Lucky writes the Reflections column in IEEE Spectrum. In his talk, Dr. Lucky mentioned quite a few interesting things:

1. More than 98% of your telephone bill reflects the cost of sending you the bill and keeping track of the accounts. Almost none of your bill goes to maintaining the equipment; the telephone companies are in the _service_ industry.

2. Over the past few years, the bandwidth capability of the technology has risen at a phenominal rate, while demand for bandwidth has remained constant.

Some of Dr. Lucky's suggestions were:

1. Give people HI-FI voice lines.

2. Give people wide bandwidth data lines.

(Note that the cost for both of the above is near zero! See above.)

3. Allow the phone companies to provide cable-tv type entertainment. (Dr. Lucky suggested that what he wanted was 40 or 50 'channels' all playing the same movie continuously, but starting about 5 minutes apart. You could start when you

wanted, go to the kitchen or bathroom and then switch 'channels' to pick up where you left off. This would be quite convenient.)

ISDN is a good idea, but it is very old technology. We should have had this years ago. Let's take the idea of ISDN, (which is basically a good idea), and update it to reflect current technology. I want a few 10Mb/sec lines coming into my house.

Please forgive me for being very naive on this subject, but it's something that I've been interested in (while perusing rec.ham-radio.*) and I would like to learn a little more about it.

I've recently compiled KA9Q (TCP/IP) package for UNIX on my 3B1/UNIX PC. I've gotten it configured so I can run SLIP between my two 3B1's over a serial connection. Why you may ask would I want to do this with my STARLAN connection, the answer that I just wanted to learn, and with two local machines, it's easiest. I'm still having problems getting the "telnet" to work properly, I think it has to do with how I start the "telunix" and the gettys on the pty's (if someone might have a clue, I'd appreciate any pointers).

Well onto my questions, please E-MAIL me I will *summarize* this ...

How does one get into HAM-RADIO and interfacing it with computers so I could conceivably connect up to the .AMPR.ORG domain and have a TCP/IP connection for TELNET's and FTP's?

What hardware does one need?

The cost involved?

How do I go about getting an FCC license (what's involved education wise)?

Does one transmit modem tones (eg. Telebit Trailblazer PEP tones) over a particular frequency? How do you interface the modem to the ham-radio equipment?

What range in miles does the transmitting and receiving get done? How big is the .AMPR.ORG network? And what computer hardware/ham-radio hardware do they generally use?

Thanks in advance for any insight.

-Lenny

It sounds very much like one of the Air Force Communications Command's propagation sounders. The FCC doesn't have diddly to say about it.

Does anyone else subscribe to International Radio's Kenwood
newsletter? If so, what is the last issue you have received?
(The last one I got was nr. 89, Sept/89). Thankx.

/Chris Thomas - AA6SQ (formerly, WA6HTJ)

FILE OF INFORMATION ON FT301 MODIFICATIONS

DISPLAY LED'S:

THESE RUN HOT AND OFTEN BURN OUT SEGMENTS. CURE IS TO REDUCE OPERATING VOLTAGE WHICH TYPICALLY RUNS >5V. FROM VOLTAGE REGULATOR Q2 ON THE MAIN CHASSIS.   A 1N400 DIODE IN SERIES WITH THE OUTPUT OF Q2 DROPS NEARLY A VOLT FROM THE SUPPLY VOLTAGE. IF THE DISPLAYS STILL WORK OK, THEY WILL RUN COOL. (PREVIOUSLY, OTHERS HAVE REMOVED RED PLASTIC LENS FOR BETTER VENTILLATION, OR HAVE EVEN DRILLED HOLES THRU TOP OF RIG.)

SPEECH PROC:

OFTEN FT301'S HEARD ON THE AIR HAVE HAD DISTORTED AUDIO. A SINGLE I.C. CONTAINS ALL THE MIC AMPLIFICATION AND ALSO DRIVES THE RING MODULATOR IN THE SSB TRANSMIT PATH. THIS AMP IS DRIVEN TO HORRIBLE DISTORTION IF

THE STOCK (HANDHELD) MIC IS USED AT FULL CLOCKWISE MIC GAIN SETTING. THIS IS THE WRONG PLACE TO HAVE CLIPPING OCCUR. ALSO RESPONSE OF AMP IS FAR TO "GENEROUS." SUGGEST LIMITING LOW END RESPONSE WITH SERIES 2. UF CAP (MUST BE MYLAR OR NON-POLAR) AT MICROPHONE CONNECTOR. HAVE IGNORED THE FACT THAT THE HI END RESPONSE OF THAT AMP GOES WELL BEYOND 50 KHZ. R.F. CLIPPING IN MY FT301 WAS ACTUALLY ONLY ABOUT 6Db. DUE TO THE LACK OF RF GAIN IN THE CLIPPER STAGES. THIS CURE FOR LOW GAIN WAS MOST EFFECTIVE: AN EXTRA STAGE OF GAIN IS AVAILABLE FOR THE TAKING ON THE "NB UNIT" CARD. (Q201 IS NORMALLY USED ONLY WITH THE PROCESSER OFF AS AN ALTERNATE RF PATH) RIG Q201 IN SERIES Q202, AND KEEP BOTH STAGES POWERED UP REGARDLESS OF POSITION OF "RF PROC" SWITCH. WITH THE EXTRA STAGE, IT IS EASILY POSSIBLE TO KEEP THE RING MODULATOR IN THE LINEAR REGION AND STILL DEVELOP 15 TO 20 Db. OF RF CLIPPING.
TO IMPLEMENT THIS CHANGE: JUMPER PINS 10 & 11 ON THE N.B. CARD SUPPLIES VOLTAGE). OPEN 1 K R205 AT WIPER TO VR201, LET IT HANG. OPEN 0.01 C204 AT TRANSFORMER, AND JUMPER TO WIPER OF R205 WITH SHORT LEAD (UNSHIELDED SEEMS OK). RUN VR201 AT NO MORE THAN ABOUT 3/4 GAIN. WITH HIGH LEVELS OF RF CLIPPING, IT IS IMPORTANT THAT THE AUDIO BE RATHER LACKING IN BASS TO AVOID A MUDDY SOUND. PREEMPHASIS ACCROSS THE FULL AUDIO BANDPASS SOUNDS PRETTY BAD, SO I WOULD UP WITH A .1 CAP IN SERIES WITH THE WIPER ON THE MIKE GAIN CONTROL AND FINALLY SHUNTED THAT CAP WITH ABOUT 1000 OHMS (ADJUST THAT VALUE OF RESISTANCE TO GIVE GOOD ARTICULATION AND STILL BE SEMI-PLEASANT.

I have dealt with Dak over several years, with satisfaction. They do back up their 30 day trial period with full refund (I even got return UPS charges). No complaints with them; but no info on this particular item. Try it and return it if unsatisfactory!

Does anyone out there know of modifications that can be made to the FRG9600
to increase it's scanning speed? I feel like 7-8 seconds/frequency is too slow
for my needs.
thanks

I'd like that too! However, don't set your expectation too high. It will be 10-20 years perhaps before this is commonly available from your local telco for the majority of subscribers at rates similiar to what you pay now.

Why? Well, the rate you pay doesn't reflect much to pay for equipment because the phone company spreads that cost over many people and many years.

Also, if you look at the actual data rate from each subscriber, it's very low compared to the 10Mbps your asking for. Worse, it's not the copper in the ground/pole limiting the bandwidht, it's the switch in the central office. It's sized to handle 10-20 of its subscribers off-hook at the same time. Massive upgrades and new technology will be required to support the total aggragate data rate indicated by your simple request. Bell is working on it (ATM networks), newer switching technology, but it's not as easy as it may first appear.

BTW, ISDN is really only an interface spec. ISDN doesn't help at all in terms of moving the data!

Our local paper has unnamed sources stating that the payload
of the Atlantis flight was a sophisticated spy satellite which
would take pictures of areas of the Soviet Union never before
photographed by satellite. Make your own conclusion.

I would be really interested to hear what "bugs" you have found in the
RC850 firmware. I bought one of the earliest RC850's for VE3TRO here in
Toronto Canada (I think it was less than the 10th unit ACC made).
The equipment has performed well over the years, and we have followed
the upgrade path all the way. We are about to install the computer
control board and the DVR. (I intstalled the DVR in a Montreal
repeater almost two years ago and had good success with it.)
We used an Icom IC22U for a 2 meter remote base on a two meter repeater,
using a pair of switched notch cavities to kill the output frequency on
the remote base receiver.
We would have liked to see a provision to lock out a number of
frequencies on the remote base, since some bright light discovered he
could dial up the output frequency and lock up the whole effort!
Generally, I found ACC very co-operative and helpful, and they certainly
make probably the best repeater controller available.

.... Graham Newton, VE3MEG, Toronto CANADA

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

Line 2

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
10-11	International Designator (Last two digits of launch year)
12-14	International Designator (Launch number of the year)
15-17	International Designator (Piece of launch)
19-20	Epoch Year (Last two digits of year)
21-32	Epoch (Julian Day and fractional portion of the day)
34-43	First Time Derivative of the Mean Motion or Ballistic Coefficient (Depending on ephemeris type)
45-52	Second Time Derivative of Mean Motion (decimal point assumed; blank if N/A)
54-61	BSTAR drag term if GP4 general perturbation theory was used. Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63	Ephemeris type
65-68	Element number

69-69	Check Sum (Modulo 10) (Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)

Line 3

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
09-16	Inclination [Degrees]
18-25	Right Ascension of the Ascending Node [Degrees]
27-33	Eccentricity (decimal point assumed)
35-42	Argument of Perigee [Degrees]
44-51	Mean Anomaly [Degrees]
53-63	Mean Motion [Revs per day]
64-68	Revolution number at epoch [Revs]
69-69	Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

```
NOAA 6
1 11416U          86 50.28438588 0.00000140           67960-4 0  5293
2 11416  98.5105  69.3305 0012788  63.2828 296.9658 14.24899292346978
```

Note that the International Designator fields are usually blank, as issued in the NASA Prediction Bulletins.

I heard a brief review on the new Icom handheld receiver, the IC-R1. I assume you know what it is (at least the catalog specs); here are a few remarks. All info hearsay from JA land.

* No frequency up-down key. Must press "enter" every time.
   Frequency dial seems okay.
* "Rubber duckie" antenna tuned to popular ham band frequencies,
   namely 140, 440, and 1300. Poor sensitivity on other bands.
* Suffers from intermod and poor image rejection when you hook
   up other antennas.
* Selling very well (sold out in many stores), but probably ought
   to wait until an improved model comes along.

CAN SOMEONE PLEASE LET ME KNOW WHAT MOBILE RIGS ON THE MARKET
TODAY CAN OPERATE AS A CROSS-BAND REPEATER ?
I HAD AN ICOM 3210A AND RECENTLY SOLD IT BECAUSE I FOUND NO WAY FOR
IT TO OPERATE AS A CROSSBAND REPEATER USING THE OFFSET. IN OTHER
WORDS , IT ONLY OPERATED FROM ONE SIMPLEX FREQ. TO ANOTHER SIMPLEX
FREQ. THUS , THERE WAS NO WAY THAT I WAS ABLE TO GO IN ON UHF
AND COMEOUT ON VHF WITH THE 600 KHZ OFFSET.
ANY COMMENTS ABOUT USEOF DUAL-BANDERS, FEATURES ETC. WOULD BE APPRECIATED.

PLEASE USE THE RETURN MAILING ADDRESS LISTED WITH THIS MESSAGE AND NOT
THE GENERAL INFO-HAMS ADDRESS FOR COMMENTING.

I know ISDN is only an interface spec. The reason why I posted, (and the only thing that makes it relevant for amateur radio use and this newsgroup), is that I feel that the bandwidth that ISDN calls for is not enough. Since equipment will have to be upgraded, and the price difference for "doing it right the first time" is not that much higher, I am suggesting that ISDN not be implemented; instead a new spec should be designed and implemented.

ISDN is too little and too late IMHO.

> RM 2493? What, if any, is the advantage to responding to a
> petition with an original and 5 copies? Thanks,

Since all matters going to the FCC for action are legal matters, certain procedures need to be followed. In particular, if you are commenting about something said by someone in particular, you MUST "serve" a copy of what you say to them as well. When you make comments about a petition itself, or when you make reply-comments about anyone's comments, you need to send them a copy. The FCC rules (Part 1) spell out exactly what you must do.

Since an NPRM is made by the FCC staff themselves, comments about the NPRM are in fact getting to the staff, so you don't have to serve a copy on them.

Don't file reply-comments unless you know what you are doing. If you don't, might I suggest learning.

```

So apparently there are THREE varieties of ADVANCED:

ADVANCED	As BASIC, plus use of homebrew transmitting equipment, maximum legal power, and the right to own (?) and operate repeaters and remote base stations on VHF/UHF only.
ADVANCED+5WPM	As BASIC+5WPM, plus use of homebrew transmitting equipment, maximum legal power, and the right to own (?) and operate repeaters and remote base stations on VHF/UHF plus limited HF frequency privileges.
ADVANCED+12WPM	As BASIC+12WPM, plus use of homebrew transmitting equipment, maximum legal power, and the right to own (?) and operate repeaters and remote base stations on VHF/UHF plus full HF frequency privileges.

It almost makes sense even here south of the border in the USA.

I've heard this many times myself. One time I heard it running across the 20 meter band DOWNWARD and I decided to CHASE IT. It was moving about 20 khz per second, and just suddenly switched off somewhere around 12.7 Mhz.

     Well, I finally passed my 5wpm, and am going to take the novice and
tech. tests (and maybe the general) tonight!
        I'm continuing to work on my code speed towards the magic 13wpm, but
I'd like to get people's opinions on how best to do it.  I'm using the
SuperMorse program on an IBM-PC (it's great), but I'm not sure of the best way
to proceed.  Some people suggest that I start building up from 5 to 7 to 10 to
13, while others seem to suggest starting right away at 13 (or even 20!).
         While different methods propbaly work for differnt people, I'm curious
to see how most of you went about it.
         Thanks!

==

I used the two RCA jacks on the back of the 440. I wired the PTT from pin
13 of the din to the spare RCA. It works ok. I couldn't find a source for
13pin din plugs. I never leave the mic in the radio because I don't like
HF phone. No problems with packet or rtty with this setup. I use the
mic level control to determin output. It varies a bit from phone, but not
alot. I prefer having manual control with the 440.

```

FT-4700 Frequency expanding modification.
Following example shows programming for 138-174Mhz, and 420-460Mhz.

1. Remove front panel.

2. Locate jumper spots 1,2,5,9,10,13 and short them with solder carefully.
(Other jumper spots must remain as current on the control unit.)

3. Turn power on, and set the display for the lower edge of UHF band
(420.000),u sing up/down buttons, and dial. Then press D/MR button.

4. Set the display to 460.000 and press D/MR. The display shows
47.75(if frequen cy of uhf). Press D/MR, and then uhf coverage is
programmed.

5. Set the display freq. to 138.000 and press D/MR. Then set to
174.000 and pres s D/MR again. the display now shows the VHF if req.
at 17.3. Press D/MR again. Now both band coverages are programmed.

6. After this modification the repeater shift is set to 000mhz, so
it must be set using the F and RPT buttons on both bands. Refer to
page 27 of manual for details.

7. Remember that transmiting outside the amateur bands is prohibited
unless you have a special licence.

I note comments from N8DGN and others about ISDN data rates. There ARE
higher rates than 64 kb/s, but probably not to the home. Also I'm being
pulled into something called Broadband-ISDN (B-ISDN), which is more or
less real depending on whom you believe. The goal is 50 megabits per second
at an absolute minimum, and some feel that 600 Mb/s is the minimum that is
interesting. Don't hold your breath for rapid availability in the US.
I'll know a lot more about current state in a couple of weeks when I get
back from the tech meetings in Dallas.

Here's a plea to the technical radio people in here:
(By the way, I am studying for my Novice license, code and all, so don't write me off as quickly as usual. Thanks.)
I have one of those little FM-only Sony Walkman devices, and it has problems (no big surprise, there). I want to separate the antenna and audio output functions of the stereo mini jack so I can better receive an FM broadcast station (KITS-FM, San Francisco, 105.300MHz, 13KW @ Mt. San Bruno) from my marginal location (60 miles southeast, in San Jose, in a south-facing office of a Faraday cage). I believe I understand that I need a DC block between an external antenna and the device that will pass >100MHz or so; that's the easy part. Now how do I get the audio part out without weirding-out the front end of the tuner? Oh, yes: and without spending any money. Obviously, I can replace the entire thing for about 15 bucks (although I *still* don't get an antenna input), but I'm doing this for the experience as much as anything. That said, fire away. Am I wasting my time altogether? (With this radio, I mean, not studying code: I can handle that :-)
Should I just go out and *buy* a radio that meets my requirements (low cost FM tuner, stereo, mini-jack audio output, external antenna input)?
Is there one? By all means send me recommendations.

I also have a Sony ICF-2010, but it doesn't have stereo, in this band or any other; SWL doesn't demand it, from a marketing standpoint. *sigh* Is it absolutely out of the question to *modify* it to do stereo? Thought so.

So, here's another chance to set a young'un straight, all you old-timers.

Maybe I can return the favor when you blow up both FATs and the partition
table on your PC (*I'm* the old timer, over there!). (By the way, the
answer to that one is: "When did you last back it up?" Sorry: even
magicians have to work with the materials at hand. :-)

Sorry if my .sig comes out twice: this is the first time I've ever posted
anything, so I made sure.

Neither can his mind be thought to be in tune, whose words do jarre;
nor his reason in frame, whose sentence is preposterous.

>while the rig is transmitting or are the switches failing just by being in
>in the circuit?

Just by being in the circuit.

I soldered in another rotary switch, and I'm able to drive it to at

least 400W on a bad edge of 80 meters without any arcing on the contacts
or capacitors.

I think the switch is just under-engineered, and could be corrected with
a parts mfgr change. There is quite a bit of current on the lowest L
setting, which is where the switch wiper ate it.

I'm in the process of building a legal-limit multi-band HF amplifier.
There is an FCC-imposed limit on harmonic content (50 dB ?), but this
can be hard to accurately measure without a REAL(tm) spectrum analyzer.

Could a rudimentary "spectrum analyzer" be rigged up using resonant
circuits tuned to each harmonic, then sampling the RF voltage ? Or
would the non-linearity make this approach unlikely to succeed ?

The approach of having a buddy listen to your harmonics is not a true
measurement, since an antenna could radiate harmonics more or less
efficiently than the fundamental.

Maybe what I am asking is how to make a spectrum analyzer out of bits
of wire and canning jars. Can't be done, right ?

I've worked V31BB on 10m before. Our QSO was very short, as if he were working a contest, but to the best of my knowledge, there was no contest. As I understand it, Jim (V31BB) worked the ARRL DX contest this past weekend with the V31B contest team.

Speaking of poor contest operators, I had the unpleasent experience of hearing a guy (don't remember the call) this past weekend during the contest. I read the mail for about 5 contacts, during which he never said his call. After the fifth, the guy at our station who was operating at the time stuck in our call sign when he QRZ'd, and he came back to us with "59 kilo". Tom, the guy who was operating, gave him his report and then asked for his call again. He said "If you don't have my call, I don't want to work you. QRZ?" Annoyed at this, Tom gave him about 30 second's worth of "I've seen some really rude operators but you take the cake, pal" sort of ramblings. The thing that really annoyed me is that if the DX guy was such a good operator, he should be giving his call on each contact. The contest rules state that the excange is BOTH station's call signs, sig report, and power or state, depending on which side of the contact you're on. Theoretically, the guy's log contains only about 10% legitimate contacts. Everybody could save time and hence work more contacts by only giving a call sign on one out of every 10 contacts, but some of us play by the rules. To decline a request for a callsign repeat is not only breaking the rules, but just plain rude, obnoxious, and shows what a poor operator you are.

Other contest highlight: we had a neighbor come to the shack complaining of RFI to her VCR. Nothing too unusual about that. However, the thing that made the incident stand out is that she was carrying a loaded rifle, had it pointed at my chest from four feet away, threatened to shoot up the station, and threatened to kill us unless we went off the air. There is a long story involved, but it all boils down to this: we weren't causing the RFI, we continued working the contest, and she got arrested for trespassing, assault with a deadly weapon, and wreckless endangerment. Women...

The moral of this story: Everybody's out for blood during a contest.

I didn't mean the RC airplane part, I meant the NTSC video part. Is broadcast quality really necessary or would something more modest (and cheaper) suffice?

>Thanks in advance,

These are the SPREAD SPECTRUM communication signals. There are usually two modulating signals. One is the useful signal which modulates the carrier (HF) in one of the common method. The frequency deviation caused by the useful signal (like data, audio, etc) is very small.

The other modulation is much greater and results in a widely spread frequency spectrum. It is the format of this modulation that characterize the communication. There are several advantages of the spread spectrum. The "spreading" format is unique for each station, and only the authorized recevers know the format. Therefore the S.S. is very secure. Secondly, since the energy is so weak (in everage sense) in a 10 KC window (that of a radio), the signal can hardly be noticed (unless slow formats are used).

Most US spied use S.S., by the way.

I heard 'way too many stations doing that this weekend. Whether it's breaking the rules or not, you're sure right that it's rude and inconsiderate. And, I maintain, wasteful to everyone concerned. I'd really like to know whether these stations have a higher dupe ratio because people go ahead and work them without waiting to find out who they are.

Right. I've certainly never heard of any incidents where male neighbors got overwrought about RFI. Uh huh. :-)

Most of us "no-coders" are sticking to the International regulations
that access to HF requires Morse code.

Can't communicators get their Morse code practice from tapes and on 2 meters?
uh... well maybe 220 Mhz?   Maybe the OF's won't go up there and help them.
Too bad.

As part of my preparation for attendance at the Canadian
grand prix this summer, I am once again looking for any
information regarding radio usage at the United States
grand prix motor race taking place in Phoenix this weekend.

If you are in Phoenix this weekend, and have a scanner, please have a listen, and note the frequencies any of the teams are heard to be using. It would also be helpfull to know which teams are scrambling their communications, and which method they are using (digital, band inversion, etc.) If someone could relay this message to other related boards, I would appreciate it, as I only have access to "INFO-HAMS" here. Thanks all 73

Advertisement from "The Frederick Post", Frederick, MD, March 6

ATTENTION
FREDERICK CABLEVISION SUBSCRIBERS

>From March 1st through March 9th 1990, SUN OUTAGES will affect all satellite-delivered channels. The satellites move into a direct line between the sun and the earth and the sun's rays overpower the satellite signal. We receive signals from 4 satellites, so time and duration of the outages will vary. They can last from a few seconds to 15 minutes and will occur approximately between 4:20 and 4:40 p.m. for most satellite services. Some will also be affected between 12:40 and 1:40 p.m.

****

My question: do many cable systems bother to place notices like this? BTW, the newspaper owns the cable system.

Here's something that may help - get a couple of 0.001-0.01 uF capacitors and
try some of the following:

1) attach a long piece of wire to one side of a capacitor, and connect the other cap lead to one of the 3 leads of the headphone jack. One or more of these should provide a noticable increase in signal strength. If not, try 2) below.

2) Using the other cap along with the one from 1), rig up a small dipole for use at the freq of your station (you said you were studying for your novice exam - good practice, huh? :-)) and connect it across two of the headphone leads until you get better reception. It may take a few tries.

```
             |
         |
         ---------||--> to phone lead
crude dipole->  ---------||--> to phone lead
         |        ^-----Capacitors
         |
```

This'll let the RF in, but keep the audio in/out.
If this doesn't work, please send me E-mail and we'll discuss it.
PS - good luck on your exam! I got my Tech. ticket in Oct and have had a ball.

  FT-4700 Frequency expanding modification.
  Following example shows programming for 138-174Mhz, and 420-460Mhz.

  1. Remove front panel.

2. Locate jumper spots 1,2,5,9,10,13 and short them with solder carefully. (Other jumper spots must remain as current on the control unit.)

3. Turn power on, and set the display for the lower edge of UHF band (420.000),u sing up/down buttons, and dial. Then press D/MR button.

4. Set the display to 460.000 and press D/MR. The display shows 47.75(if frequen cy of uhf). Press D/MR, and then uhf coverage is programmed.

5. Set the display freq. to 138.000 and press D/MR. Then set to 174.000 and pres s D/MR again. the display now shows the VHF if req. at 17.3. Press D/MR again. Now both band coverages are programmed.

6. After this modification the repeater shift is set to 000mhz, so it must be set using the F and RPT buttons on both bands. Refer to page 27 of manual for details.

7. Remember that transmiting outside the amateur bands is prohibited unless you have a special licence.

> thing?

Right you are. This annoying QRM emanates from a device known as a "chirpsounder", manufactured by an outfit called BR Communications (there may be other sources, but I haven't heard of any). The U.S. military (and Canada, amongst other countries) has a fairly extensive network of these things to support their HF links. Their gratuitous use of spectrum assigned to other services is, no doubt, justified on the basis of National Security. Funny thing though... I would have thought that this justification would only apply in times of National Emergency. Oh well. The next time you get jolted out of your chair by that carrier sweeping through your headphones, try and remember that it's all for the cause of peace 'n freedom, etc. :-)

Why not transmit less than 100% of the time? A 555 timer IC driving PTT would be ideal. It might even fit on an IDer board.

The failure of DX stations to identify is something that really frustrates me. I think people learn to operate by imitating people they hear, and unless we can get them to change, the chances for seeing improved practices are bleak.

I feel that the main reason DX stations don't identify is that they are afraid of big pileups, and they think that giving their callsign out frequently leads to this. What they don't realize, however, is that failure to identify means getting worked over and over by the same "big" stations, each of whom do not have the time to sit and wait for the DX guy to ID.

In other words, if you give you callsign after every QSO, your pileup could actually be smaller, because the guys who have already worked you will simply move on.

I have heard a few of these sweepers. They tend to occupy 10 and 20 meters. Often they have nasty notes (raw AC with hum). Certainly some of them are industrial processes. There are two 'Industrial' frequencies around 13.56 and 27.12MHz for these things. They are diathermy machines, RF-heaters, driers, plastic-welding machines etc. Usually a tuned power-oscillator, AC on the anodes seems to be commonplace. Powers in the tens of kilowatts range are not unusual. They are often coupled to the workpiece with lossy unscreened cables, and drift with changing load capacitance. It obviously doesnt take much imagination to see one of these things drifting into the 10 or 20 meter bands....! When you have 10Kw to play with you do not need an efficient antenna. Add in radiation back down the power lines, from the cooling pipes (they often have water-cooled anodes on the TX tubes - how do you put a choke in a water-pipe??) and undoubtedly more than a whiff of the RF gets out. That is what we hear as 'sweepers'.
When the bands are open, these things can cover enormous distances!

Another popular frequency for medical diathermy sets (used for localised heating/cauterising in hospitals) is around 48MHz. These could easily cause QRM to 50MHz.

I am looking for a keyer board for an IBM PC. Does anyone have any suggestions and supplier info. What I want is a piece of software that uses one of the communications ports for paddle input and xcvr output with software that provides all the keyer functions. I asked this question a few weeks ago and got one answer -- unfortunately the sender didn't provide supplier information. You asssitance with this matter is appreciated.

This is the second CALL FOR VOTES for the creation of a new newsgroup to provide a forum for the discussion of noncommercial radio among broadcasters and listeners.

Vote by replying to this article. Votes must be clearly stated
as for or against rec.radio.noncomm as described in this article.
People who have voted so far are listed at the end of this article.
Please check this list if you have already voted.
Votes will be accepted until March 13, 1990.

NAME: rec.radio.noncomm
CHARTER: unmoderated discussion of noncommercial radio.
Some topics to discuss are:
- listener opinion
- noncommercial AM/FM radio of the college, community, and NPR variety
- carrier current and cable based radio
- do trade journals manipulate or aid?
- upcoming conventions such as the Nat'l Assoc. of Broadcasters/BEA meeting in Atlanta and the Intercollegiate Broadcasters Society in NY
- the newly released "Public Radio in the 1990s" report by The Public Radio Expansion Task Force
- the FCC and its regulations
- obtaining and managing non-commercial grants
- programming sources

Does anybody know where I can buy replacement parts for the
TR-44 rotor? I need to replace the pot for positional data in
the rotor.

I know what you mean!

As far as DX stations who don't sign their callsign after every contact,
it's not so much to avoid generating a big pileup (hey, if I hear a DX
station with a pileup and not identifying him or herself, I'll hang around
to find out who it is), but to maximize QSO rate. If a station can work 200
stations in an hour by signing the callsign after each QSO, but another
station can work 250 by *not* signing the callsign as frequently, who's
gonna win?

jim, AD1C

Does anyone out there have an address for General Instruments? I am
looking for the Integrated Circuit division for a data sheet on a
MOS IC.

I didn't think they were around anymore. I may be mistaken.

Thanks!

>ISDN. It seems to me that ISDN running over a few microwave links
>would solve both of our linked repeater and packet problems. This is
>something the Amateur community should be on the leading edge of.

ISDN isn't a protocol. It's a set of services and interfaces. ISDN is
what the phone company supplies, implemented using digital (rather than
analog) signaling. Most of its components are taken from existing
telephony; some are new -- mainly the call setup protocol and the
physical link (wireline drivers). It has nothing to do with microwave
links or anything else like that; it's what you'll get soon when you
call and ask for a phone.

How can hams use it? The same way we use any other telephone wormhole.
But then it's not "ham radio" per se. On the other hand, ISDN means
that the non-ham BBS/modem crowd will soon have 64 kbps dial-up (the
ISDN circuit rate). And they don't even know morse! ;-) Somehow ham
radio won't look state of the art anymore. (Hey, it _was_, years ago.)

In article <23214@usc.edu>, kjh@pollux.usc.edu (Kenneth J. Hendrickson) writes...

>ISDN is much too litle and far too late (IMHO). I want a few 10Mb/sec
>lines coming into my house.

See below about "Broadband ISDN".

>Recently I saw Dr. Robert W. Lucky here at USC. Dr. Lucky writes the
>Reflections column in IEEE Spectrum. In his talk, Dr. Lucky mentioned
>quite a few interesting things:

>1. More than 98% of your telephone bill reflects the cost of
>   sending you the bill and keeping track of the accounts.
>   Almost none of your bill goes to maintaining the equipment; the
>   telephone companies are in the _service_ industry.

Either you misquote him or he's full of bat guano. How do you think they pay to maintain the equipment -- government handouts? Prices and true cost are out of line (less so than a decade ago) but telephone companies have lots of real costs, particularly capital (recovered as depreciation) and labor (guys pulling wires).

>2. Over the past few years, the bandwidth capability of the
>   technology has risen at a phenominal rate, while demand for
>   bandwidth has remained constant.

Partially true; demand has risen, especially on the data side. But not as fast as supply. This has of course reduced profit margins...

>Some of Dr. Lucky's suggestions were:

>1. Give people HI-FI voice lines.

ISDN allows the 7 kHz ADPCM to be used over its 64 kbps circuits; that's better than the usual 3.1 kHz. B-ISDN allows true hi-fi; CD-quality was demoed in France some years ago.

>2. Give people wide bandwidth data lines.

>(Note that the cost for both of the above is near zero! See above.)

B-ISDN will allow high bandwidth (as in 150 Mbps). It ain't cheap, though; they have to pull glass to your door. That might not cost a lot more than copper, but the _installed_ cost of copper averages something like $1k/house, capitalized.

>3. Allow the phone companies to provide cable-tv type
>   entertainment. (Dr. Lucky suggested that what he wanted was 40
>   or 50 'channels' all playing the same movie continuously, but
>   starting about 5 minutes apart. You could start when you
>   wanted, go to the kitchen or bathroom and then switch 'channels'
>   to pick up where you left off. This would be quite
>   convenient.)

B-ISDN allows dial-up of a video channel (around 135 Mbps). Not that
the CATV crowd is happy about that, but that's show biz!

>ISDN is a good idea, but it is very old technology. We should have had
>this years ago. Let's take the idea of ISDN, (which is basically a good
>idea), and update it to reflect current technology. I want a few
>10Mb/sec lines coming into my house.

Narrowband ISDN is mainly old technology, ordinary digital telephony and
X.25 with some new glue. Broadband ISDN is newer technology, using
all-glass transmission (well, mostly glass) and interface rates in the
150 and 600 Mbps range. It's got a lot of other "novel" features, and
requires some more development before it'll be practical, but you can
expect early deployments within a few years.

N-ISDN is better than analog telephony. Let's appreciate it for that.
Even 64 kbps beats a modem!

     Sorry for the bandwidth splatter, E-mail has been bouncing....

     Mr. Cook,

          Thanks for the E-mail on old-fashioned radio protocol,
     I tried to reply but it bounced.  My question is this;

          I was in Suadi-Arabia about 6 years ago with a Florida
     Ham by the name (i think?) of "Ted Cook".  We used to ride
     motorcycles in the desert while contemplating how to get a CW
     rig operational.  Could this be you??  If so, how are you doing??
     If not, nice to hear from you anyway and what is your REAL mail
     path??

               de km4jn (was WB2DJH for a looooong time).

Well, I see I've not been doing a very good job of 'advertising' the
un-net (Saturdays, 1700 to 1900 Z)....   :-)

Well, in any case, I'm still attempting to be on the air every saturday
9sorry, I missed last Saturday tho) from 1700Z to 1900Z (Z==UTC==GMT)
in the general neighborhood of 28.390 and/or 28.410 MHZ for the 'usenet
un-net'. In the past I've tried to stay between those freqs, but sometimes
band is such that I begin moving 10kHz either way off the end...

In any case, it looked like it was time for me to 'remind' everyone
about the un-net. I promise to make a very strong attempt to get on
the air this weekend, lets see how many usenetters we can talk to!
(Then, once your rig is warmed up, you can go to the Club Net mentioned
above... :-)   )

The station that ID's every time should win, because the other bozo
would only have, say, 25 legitimate contacts. But alas, nobody insists
on proper procedure and things get progressively worse.

> that would give people and easy entry into Ham Radio, give them on the air
> experience, and give them five years or so to learn the code.

That defeats the purpose. The purpose is NOT to trick people into getting into ham radio just so hams can get them to learn code, but rather to let people who never need to learn code to be IN ham radio without having to bother with learning it at all.

> Heck, you could even let the communicators re-new if they re-passed the
> theory test again.

Sounds fine to me, let's make ALL classes re-newable by exam only, and while we are at it, let's do it every TWO years. :-)

> Seems to me the Novice used to be two years, non-renewable. Maybe twp
> years was a little short, but I think the idea was right.

The idea of giving someone a short time to upgrade may be OK, but I strongly object to your idea of not letting there be a CODELESS license that people can upgrade TO.

I hope non-hams reading these notes don't get the idea that ALL operations on the HF ham bands are rude and crude. 99% of hams are reasonably considerate operators -- it's just that we tend to remember the other 1%.

SUGGESTION: Try CW. There seem to be far fewer loonies on this mode, and the ones that are there seem much less obnoxious. (Something about the difference between voice and tones.)

RTTY DX Notes, 1of3, 3/2/90

RTTY DX Notes for Weekending 2nd March 1990.
Part 1 of 3.
BID: $RTDX0203

Why must everyone have a mailbox or BBS? I know that they come with the various units that are available on the market these days, but whatever happened to communication? And why should all the mailboxes be on the same frequency? The author of these notes had the pleasure (?) of sitting on a frequency for four and a half hours the other day while four or five mailboxes listed their bulletins. Oh well, I guess that while their mailboxes are spitting out this stuff the owners can go out and play golf or something. It's a pity that people dont talk to each other these days.

Our thanks this week go to G0ABI, HL9TG, I5FLN,JA1BLV, JG1NBD, OD5NG, TG9VT, VK2EG, W1DA, W2JGR, W6/G0AZT and the Tri-State DX Association VHF Packet Cluster (NN2G, NB2P, WB2ZMK and others). Thanks, chaps. At least some people do communicate.

RTTY DX Notes, 3of3, 3/2/90
RTTY DX Notes for Weekending 2nd March 1990.
Part 3 of 3.
BID: $RTDX0403

BZ4RCC (Chang) wants his cards via Box 1827, Nanjing P.R. China while BY1SK (Meng) says to send his cards to Box 2916 Beijing, P.R. China. It is important when sending cards to the Chinese stations, that the name of the operator be included in the address.

TR8XX cards go to F2CW.

RH0W/RA4LU is via Box 88 Dimitrivograd-12, 433510 USSR.

Cards for EK0AH, KL7/RW3AH are available from Box 899 Moscow, 127018. USSR.

V31HQ will collect his cards from DL1ZP.

While 8Q7DN QSLS via JA4VUQ.

Information of Interest:

The Western Saraha operation is scheduled for commencement on 18th March for one week. The callsign will be S01LYNX and the QSL manager is EA2JG, Areli Exteguren, Las Vegas 91, 01479, Luyando (Alvaua) Spain. It will be an all band, all mode operation. The calls of S02, S03 and S04 may also appear.

Martti, OH2BH is still on schedule for Aves Island (YV0) around mid March.

Lord Howe Island will commence operation March 28th. It is still not known if there will be any RTTY operation.

ZS9A will be on 21064 every Saturday around 1700 to 1750Z. It is hoped that he will soon be on around 2300Z for the VK and Asia areas.

BY1SK (Meng, home call of BZ1FB) also runs ARQ and packet. His packet call is VS6UF where he has a BBS.

ZD8BOB says to hold his cards until mid June as he is going on vacation at this time.

Cocos TI9. TI2US stated that the trip is still on, but the exact date is not known as yet. He was not sure about RTTY either.

RE: Donations to the Spratly deal. Do not send donations to NT2X, as the information that I received was not completely correct at the time. More later.

GL DE DX1 (VK2SG) via TG9VT.

Some upcoming contests you don't want to miss:

April 14: Combined Sprint and Chess contest. Same basic format as Sprint, but stations must work other stations enough times to complete a chess game. On initial contact with a station exchange first moves, (station calling CQ plays White), then sprint at least 5 KHz and begin game with second station, etc. Continue games by finding the stations again one at a time and exchanging one move. Score is number of games played multiplied by number of wins. Draws count half points. No boards permitted. CW only. Brilliancy prizes.

April 21: Olde Phartes Conteste. Exchange latest prescription number, days since last doctor visit and full description of current medical symptoms. Each exchange must last at least one hour. 75m only, use of callsign optional. Contestants must remain alive for the duration of this 24-hr contest.

April 28: Modified CQWW. No contacts allowed with JA, YU or UB stations. Special certificates for stations with total number of contacts in double figures in spite of this limitation.

May 5: 10-10 contest. As for regular phone 10-10 contest, except that operators giving their 10-10 numbers in "dollars and cents" are disqualified from future contests. The contest is therefore not expected to take place in following years.

May 12: Belize Egoists Contest. U.S. stations may work only Belize (V31) stations. Contestants may not use MFJ equipment unless disparaging remarks about it are made as part of the exchange. Belize stations need not give callsigns or follow any usual contest rules, and may flame any callers mercilessly. U.S. stations who attempt to reply to flames are disqualified.

May 19: Usenet Contest. Exchange full e-mail addresses, and opinions on no-code license. Bonus points for creative flaming.

Arun,

I suppose, that the QRP HF transceivers, which You describe in Your mail, are made by MIZUHO (japanese) company.

This transceivers are readily available here in Germany, but in the last (March) Issue of RadComm (Radio Communication, which is the member magazine of britisch RSGB), is an advertisement from british company selling this MIZUHO MX line.

They sell this QRP transmitters for 80, 40 and 20 m (only?). The power ist 2 Watts and each rig is VXO controled. What you get is 25 kHz tunning range in the 80 and 40 m and 50 kHz in the 20 m. One Xtal is supplied (I don't know, how many Xtals can be in simultaneously). Another features are IRT, noise blanker, S-meter, speaker, morse key, BNC socket. You can powered it from AA cells or from external power supply. The size is about 66 mm width, 39 mm high and 142 mm deep.The mode is CW and (perhaps) SSB (I am not sure here, perhaps the mode is CW only, with possibility to receive SSB).

The price in the british magazine is 189 pounds. Sorry, I cannot give you german price, the last issue of ,,cq DL" (which is our radio amateur magazine from DARC) shows no price, only the comment ,,Achtung! Kurzwellen-Mono-Bander jetzt zu Sonderpreisen" (Attention! HF monobander now for special price).

I believe they required demonstrating such knowledge in advance, hence a test
is required. I don't know if any specifications of the test are indicated.

In previous articles

>>... poor contest operators ...
>>... about 5 contacts, during which he never said his call.
>

Yes it's rude when contacted and the operator refuses to give
his call. But then again, there's something wrong with the
operator who hasn't the foggiest idea who the station on the
other end of the pile-up is, but jumps in to work them. That's
poor operating practice too IMHO. There's a pile-up of stations
who have listened long enough (perhaps longer than they should
if the other operator doesn't give his call very often) to know
who's on the other end, and here comes some schmuck with more
kw than patience who jumps in to work the station. The ones
who stand on the outskirts of the pile up yelling "your call [please]"
with no call of their own are about half a step worse than those
who work the station then try to figure out who they worked.

Oh, well I still enjoyed my small part of the contest. I worked
perhaps 30-40 stations during several short sessions on 15M.

The Department of Defence, as a U. S. government user, is administered by the IRAC/NTIA, not the FCC. Ironically, not even FCC operated radio transmitters are administered by the FCC.

>
>   I'm continuing to work on my code speed towards the magic 13wpm, but
>I'd like to get people's opinions on how best to do it. I'm using the

If you want to minimize the time to get to 13 wpm , don't bother listening to anything less than 13wpm. Start with the 20 and ramp down to 13 over 30 minutes or so, just write down any letters you make out and don't worry about checking your text, you'll know when you are ready to take the test. You could do a little 10 at the end just to make you feel better. Try to practice once a day, and don't do it if you are tired and not concentrating well.

This was the method suggested to me, and it worked great. I used the same method to get to 20 copying in my head, start with 35 wpm (!! machine-gun fire!!) and by the time W1AW gets to 20, it seems slow!

My only problem now is trying to copy the crap on the air that passes
for morse code, :-) (blech).

73 & good luck!

Why not just go with a "Computer-Class" license. Not only would there be no Morse Code requirement; there would be no analog questions on the written, just digital electronics (after all, the radio part is just another peripheral device). This would keep out all the OF's that don't want to waste time learning all the digital electronics and computer terminology, and they wouldn't clutter up the computer bands with all that CQ contest, and beep-boop stuff.

I was the person who originally posted this item... In any case I have built
the A&A engineering spectrum analyzer and it is great fun. Another
company sells PCBs/Kits that +might+ be a cheaper way to go... But I am
not sure... That company is called Science Workshop.

The main problem is finding an attenuator that can take 1KW+ down to a level that will not fry the spectrum analyzer or find a directional coupler that will do the same thing (although the ARRL handbook says this is not as accurate)..

If you belong to a club, maybe the club could buy the kit and various members assemble it and leave it available for club members use.... But this does not seem practical.

If you have a shortwave reciever around an article in 73 Magazine might work out. This used a shortwave reciever and a scope as well as some logic to interface the two. The accuracy of this will not be very good though.

Here is the latest on the TM-721a display upgrade.

It is on its way from Japan and should be here by the end of the month...

Did not get an update on cost or procedures to return units for the upgrade... Call kenwood at the end of the month to find out about getting your radio with a display that can be read.....

In article <8462@netcom.UUCP> jxh@netcom.UUCP (Jim Hickstein) writes:
| I have one of those little FM-only Sony Walkman devices, and it has problems
| (no big surprise, there). I want to separate the antenna and audio output
| functions of the stereo mini jack

Fast & Cheap Solution:

Get a short piece of fine wire and wind it around the ground (or common) connection of the headphone cord. The ground connection is the one closest to your fingers if you hold the jack like you would to plug it in. Plug the jack into the socket of your Walkman (this will wedge the wire in between the jack and the body of the Walkman). Now connect an antenna (random hunk of wire) to the short wire.

Why this works: Most Walkmans use the shield/common line of the headphone cord as an FM antenna. Inside the unit, this line is connected to the FM input of the radio proper through a capacitor and to the audio ground through a small coil (inductor).

Better reasons to try this: 1) I've done it and it works. 2) It doesn't require opening your Walkman. 3) It can be undone if it doesn't work. 4) It's outrageously cheap.

Re: 949C switches

>I think the switch is just under-engineered, and could be corrected with
>a parts mfgr change. There is quite a bit of current on the lowest L
>setting, which is where the switch wiper ate it.

An update.

I replaced the switch, and gave it my standard "wrong end of 75 meters" test. The new switch held, but the capacitors arced-over at 200W. I measured the plate separation (.05"), and the Handbook sez this is good for 1000 volts. Wow. I didn't know a shortened mistuned quarter-wave ground plane antenna could develop that much reactance.

Anyway, it's time to go to a hamfest and get some REAL(tm) components. In fairness to MFJ, the 949C works well with barefoot HF rigs in the 100W PEP range. I think that's its intended purpose. I'm able to tune everything but dead shorts at that power level.

The subject of "mod's" for the IC-04AT have probably been brought up before here on the NET, but for some reason I have managed to miss them all. So, if some kind ol radio amateur could dig in to his or her files one more time, and post them for me, it would be muchly apprieciated. I am specifically looking for the mod's that pertain to out of band operation, and RX audio volume improvement.

Please post or e-mail, and thanks.

I would expect broadcast-style signals in the 29-31 MHz range to be harmonics. Of course, harmonics are also found elsewhere, but I hear reports of them in this area quite often in the DX news info given by Glenn Hauser on Radio Canada Int'l's SWL Digest program, or in his World of Radio program on WRNO (& other outlets). In Alaska, I suppose it is reasonable for you to be picking up harmonics of Soviet and other Asian stations; most of the ones we hear about down here are Spanish-language.

Regards, Will

Get on the air.

The Morse programs teach you how to pass the test but not how to operate CW. Many of my friends are afraid to get on the CW bands because they only copy "sanitized CW" from their PC.

Who knows??? You might even have fun.

Seriously, it is important to be able to get on the air with CW and there are some really nice people on the bands. Not as much "territorialism" as in the phone bands.

Instead of using an RC plane with a TV camera to spot fish, maybe a tethered balloon with the camera would work. The tether would be the coax cable for delivering the video. This gets rid of the problem of broadcasting the signal, and you don't have to worry about flying the plane, or crashing it. You also don't have to worry about running out of fuel, and where to land it.

hope this helps   73 de WA2ISE

>
>--Phil Howard, KA9WGN--

Be aware! This does not provide a "repeater" operation like on your local hilltop (unless it was built by lids) - this "cross-band repeater" isn't full duplex. If you are talking on some two-meter channel and allowing this mobile radio to retransmit that on some 440 channel, you can't hear anything that is going on up on that 440 channel until you release the pickle. Generally, so long as you know this it's ok.
Here in La La Land, we get folks (I like to think of them as the "No Code" types (hi hi)) who buy one of those rigs, then immediately put them on the air as "repeaters" at their house, choosing some quiet channel (usually our repeater input!) as the dump out on 440; then the 2m input is set on some 2m repeater, and there's no end to the annoyance. And there's no way to talk back as the repeater never drops, and none of them speak English anyway (how about a "English Only" license?!?!). (sigh.)

Remember: Radios don't have a mind of their own; kinda like some of their owners.

Adios - Jon

I believe the international regulations require a KNOWLEDGE of Morse code
for HF operation, but I have never heard that they require a code TEST.

I for one would be perfectly comfortable with the idea of Communicators
having HF Novice privileges (code only). They can't operate code if they
don't know it.

I know of no HF spread spectrum system in the field today. (This isn't to say there isn't one. In fact, I've heard rumors. But I've heard of no production contracts.) The lowest-frequency SS systems I know of (e.g., SINCGARS) are in the 30-88 MHz band, and are frequency-hopping rather than carrier-swept or psuedonoise-spread.

>The other modulation is much greater and results in a widely
>spread frequency spectrum. It is the format of this modulation
>that characterize the communication. There are several advantages
>of the spread spectrum. The "spreading" format is unique for each
>station, and only the authorized recevers know the format. Therefore

>the S.S. is very secure. Secondly, since the energy is so weak (in
>everage sense) in a 10 KC window (that of a radio), the signal can
>hardly be noticed (unless slow formats are used).

And a swept carrier would be about the stupidest method you could use for a SS signal, unless you didn't care about being detected and intercepted. SS is only secure if the enemy can't find enough of your signal to figure out what kind of encryption and hop rate/PN sequence you're using. Sometimes just having your signal *detected* can be deadly, because the enemy can DF on it and blow you away.

>Most US spied use S.S., by the way.

Not to mention the Army. And the Air Force. And, soon, your cellular phone.

Oops. got so busy flaming I forgot to present my hypothesis.

I've heard about this kind of thing in my graduate EM classes. Forget the common name (I'll look it up tonight), but it's essentially an ionospheric effect.

Well, I guess I now understand why everyone hates contests so much. I tried in vain to convene the College Net despite the DX contest. Besides having to spend quite a bit of time trying to wedge myself into a nearby frequency I had the pleasure of one OF explaining to me how all nets get closed down for contests. Arrgh!

In any case, I wish to try this net again. However, I think it would be best to wait a few weeks. These next couple of weeks fall within most schools spring breaks. Plus, the weekend of the 24th is CQWW and I have given up fighting international mayhem for the moment. I propose we retry this on the last weekend in March. Thats Saturday, March 31 at 1800Z on 28.425+-. My apologies to Rusty - I have known of your net and have tried to catch it a few times with no luck. Perhaps I'll try this weekend.

I will post a short reminder prior to the end of the month.

Scott

BTW: are any of the College ARC's interested in a radio chess match between our respective clubs?

I disagree with 100% of this. I think there is something really wrong with this attitude that the DX operator's time is more valuable than mine. The DX contest operator is a just guy with a radio, the same as me and everybody else on the band.

> The ones
> who stand on the outskirts of the pile up yelling "your call [please]"
> with no call of their own are about half a step worse than those
> who work the station then try to figure out who they worked.

I disagree with 50% of this. I put those frustrated people on a par with the DX station who is also not signing his call, although I secretly believe the DX station is getting what he deserves when he lets this happen *during a contest.*

I'm all in favor of DX stations increasing their throughput, but not at the expense of selfishly wasting the time of others. I consider the "but it improves my throughput" argument similar to someone saying "when I work a station in heavy QRM and I miss part of his call, it is more expedient to select a few random letters and fill in the parts that I missed."

The ultimate irony in all this is that these ops often spend more time saying things like "Q-S-L Q-R-Z" than it would if they would just say their callsign "X-E-2-blah-blah."

We've had a chronic problem with our riometer (gadget which monitors cosmic background noise near 30 MHz) picking up signals instead of noise when the skip is good. I've monitored the frequencies off and on, and sometimes I can hear some very faint broadcast stations in the 29-30 MHz range. They are generally too faint to hear what is said, but sometimes one is strong enough to identify the language as a slavic variety. Perhaps a Soviet home service? If anyone has any loggings between, say, 29.8-30.2 MHz, I'd be very interested in hearing about it.
Thanks,
Don Rice, KL7JIQ

I received a catalog from a mail order firm in Cagona Park in California
called DAK. They are selling a Digital PLL Tuning Shortwave radio having

```
     AM -(530-1630)KHz
     SW - (3200-21750)KHz
     FM - 87.5-108 MHz
```

It also has 20 preset memory, clock/alarm/timer. Ext. Antenna jack,
Illuminated LCD display.....All for US$50.00. The price seems too
good to be true. Does anyone have any information on this product
or the company ? There number is 1-800-325-0800.

Any information on this would be appreciated.

Thanks,
Ranjan

> Why is it that the Canadian license was called "digital"
> when it in fact was really a "nocode" license?

It was called digital because there's a big essay format component on the exam that is 100% concerned with digital issues (queueing theory, information theory, packet and networking ideas, modulation & encoding, & c.) How come you're so concerned to make sure everyone calls it a "no code" ticket? It doesn't have anything about disco dancing either - shouldn't it be a "no-disco" ticket?

What I mean here is that you seem to be more preoccupied with what the class is _not_ than with what it _is_. Classification by negatives is not, IMHO, a very useful activity. You wrote a CW exam, which is honourable, and you can run packet if you like, which I find strange.

I wrote a packet exam, a regs-and-operations exam, and an electronics exam. A general writes the same regs-and-operations, a less rigourous electronics exam, and a CW exam. I think the setup in either case is good in that it wants to see demonstrable proficiency in the mode(s) that the ham wants to run.

Do you see me going around calling generals "no-packet" and making out that they're some lower form of life? Why are you so eager to point out my (admitted - CW is a useful mode and an art) shortcomings? Jealous, maybe?

> How much effort was made by already licensed hams to get new hams to join
> the hobby?

The already-licensed hams _I_ knew encouraged me to go for Digital.

I need help identifying a couple of transistors. They are marked 'GM0290A',
have a Texas Instruments logo, and 4 connecting leads. They are in the
front-end of a VHF radio - they look like RF amplifiers to me.
No part-numbers like these appear in my TI catalog.
What are they? PNP, NPN, Silicon, Germanium? In view of the age of the
equipment (early 1960's) i would guess Germanium PNP but i want to be sure...

How about a SPELLING test?

If you had any discipline at all you would learn to spell better.

And if you had, it would not have changed your attitude, but rather you
would have just given them all the standard lectures on discipline.

I have my own kind of discipline.  It works like this: if it's something
I know I won't want to do or finish, I won't start it in the first place.
I guess I broke discipline when I took the Novice code test.

I hate to say it, but that's probably true. The original idea behind testing at all was to make sure you didn't cause harm by interfering with other services. Additional testing for higher grades was instituted because improperly adjusted 'phone' transmitters could cause havoc. Later the FCC decided that was obsolete thinking. Later, the ARRL that came up with the quaint notion that a 'classless' society was 'unamerican' and persuaded the FCC to reinstitute "incentive licensing'.

Today, with modern radios, the only testing truly necessary from the administrative point of view is on rules and regulations and perhaps some operating procedures. Anything else is more for social rather than technical reasons. The remaining question is which social benefits you consider important for best results and to achieve them. Obviously, the present junk on many ham bands shows the present system isn't working as intended.

NTSC video for spotting fish? I doubt that's the best solution to the problem anyway.

No. Noone knows for certain where the term originated, but it does pre-date the Hammarlund Co.

"Robert Carpenter, you asked for it..."

PR Docket No. 90-55

In the Matter of

Amendment of Part 97 of the RM-6984 RM-6985
Commission's Rules Concerning RM-6986 RM-6987
the Establishment of a Codeless RM-6088 RM-6989
Class of Amateur Operator License. RM-6990 RM-6991
RM-6992 RM-6993
RM-6994 RM-6995

NOTICE OF PROPOSED RULE MAKING

Adopted: February 8,1990;   Released: February 16, 1990

By the Commission:

I. INTRODUCTION

1. In this Notice of Proposed Rule Making (Notice), we propose to establish a new class of amateur operator license that would not require the applicant to prove that he or she can send and receive manual Morse code telegraphy messages. This proceeding was initiated by twelve petitions for rule making filed on matters generally relating to the amateur operator license class structure, requirements, and privileges./1

II. BACKGROUND

2. The amateur service exists for the purpose of self-training, intercommunication and technical investigations carried out by duly authorized persons interested in radio technique solely with a personal aim and without pecuniary interest./2 Article 32 of the international Radio

Regulations requires, among other things, that each person seeking a license to operate the apparatus of an amateur station prove that he or she has the ability to send correctly by hand and to receive correctly by ear text in Morse code signals. Although this requirement may be waived for an operator of an amateur station transmitting only on frequencies above 30 MHz/3, each of the five classes of operator licenses issued by the Commission/4 requires the applicant to pass an examination in the international Morse code./5

3. Over the years the Commission has received requests from persons who want to pursue the purposes of the amateur service, but who argue that Morse code telegraphy is an unnecessary barrier to obtaining a license. Historically, however, the amateur community has strongly supported a telegraphy skill requirement for every class of amateur operator license. In a 1974 rule making proceeding,/6 and again in a 1983 rule making proceeding,/7 amateur licensees showed nearly unanimous opposition to proposals for a no-code license.

4. In the 1974 rule making proceeding, we proposed an overall restructuring of the classes of amateur operator license. Included in those proposals was the establishment of a codeless class of license. Although it resulted in several improvements to the license structure, the proceeding was terminated without action on the codeless license class./8 It was during the pendency of this proceeding that the computer-aided license application processing system currently in use was developed. The capability for processing a sixth class of license, therefore, was incorporated into the design for the system. In the 1983 rule making proceeding, the Commission again sought ways to provide a class of codeless license. One proposal was the deletion of the slow speed telegraphy examination requirement for the Technician Class license./9 The alternative proposal was a new operator license class patterned after a Canadian codeless class of amateur license, and having very difficult written examination requirements. This proceeding was also strongly opposed by the amateur community and was terminated without action./10 The above-listed petitions initiating this proceeding, however, indicate that the sentiment in the amateur community now appears to favor a code less license class. The ARRL, for example, states that it now supports a codeless license as being "beneficial to the future, short and long term of the Amateur Service"/11 The issue of a codeless class of amateur operator license, therefore, should be considered in light of current circumstances in the amateur service.

III. DISCUSSION

5. A significant segment of the amateur community has a new view of the role of telegraphy in the future of the service. David Stall states that "numerous recent surveys

have demonstrated that the concept of a no-code license is rapidly attracting a wide base of support within the amateur community."/12 The ARRL states that its recent studies show:

> Encouraged by changes in the FCC rules, packet radio and other digital modes have become extremely popular and have led to amateur radio becoming increasingly attractive to computer-literate individuals who possess the ability to contribute significantly to the service, but who fail to perceive the relevance of manual Morse code. Many amateurs welcome the idea of providing a gateway to these individuals. The possibility now exists to dispassionately evaluate a codeless amateur license on its own merits. It is this factor that accounts for what the League perceives as a significant shift in attitudes among amateurs toward a codeless amateur license./13

6. The SCATG states that the time is right for a codeless class of license:

> Morse code operations were once the only way to make radio communications possible. It is now just a facet of an entire spectrum of possible methods of radio communications. It is no longer in keeping with the basis and purpose of the Amateur Radio service to stress one facet of radio communications over all others. Knowledge of code doesn't eliminate rules violations or uncourteous operations./14

7. Burt Fisher, a teacher of electronics at a regional high school, states "the public need would best be served

if there were a door into amateur radio that had a limited code requirement. Once in the door, these youngsters would be tempted to the rest of the world (and technology) of amateur radio. The public would be served as the base of potential scientists and technicians would be enhanced...." He believes that a written examination could be used to ascertain that an entry level license applicant has knowledge of telegraphy./15 Michael Trahos believes that it is essential to have a codeless beginner license so that the amateur service will not stagnate or experience a decrease in the number of licensees. He believes that if a codeless license is not established, the number of licensed amateur operators will decrease, with a consequent increasing re-allocation of amateur service spectrum by the Commission to the land mobile services./16

8. John McCord believes a codeless class of license would "attract many young minds to the hobby of amateur radio...."/17 Dennis and Linda Welch find the issue of a codeless class of license contentious and defended mostly by the older amateurs and championed by the very population needed for expansion./18 Bill Welsh, who has a personal preference for code operation, foresees "that its years as a realistic amateur radio licensing requirement are coming to an end."/19 James E. Taylor states that telegraphy is no longer necessary and that the number of amateur operators must be drastically increased in order to "continue to justify our existence."/20 Clement Bourgeois, however, disagrees. He states that a knowledge of telegraphy by every amateur operator is essential. He does believe, however, that the high speed telegraphy examination/21 should be reduced to 15 words-per-minute or less. Larry Ballentine suggests that telegraphy examinations only require the examinee to recognize telegraphy characters, rather than to send and receive text at specific rates of speed./23

9. Operator license structure. The petitions espouse various views on the structure of the license ladder. The general consensus, however, is that a codeless class of license should be the beginning step on the ladder. The ARRL believes that there is nothing antiquated or irrelevant about the Morse code, or its use in the Amateur Radio Service, but that this is a "matter that some individuals must learn for themselves, in order to appreciate that relevance."/24 Most of the petitions favor a structure that avoids any negative effect upon any current licensee. One approach would add a sixth class of operator license. David Stall recommends this approach, with

the sixth class modeled after the Novice Class, without the telegraphy requirement. He believes that a codeless license should provide "a no-code entry into amateur radio without disrupting the existing classes, privileges, or incentives."/25 Burt Fisher also favors the sixth class approach,/26 as does ARRL, with the codeless class positioned in the license structure so that there is an upward path "to the present Technician license by way of a five words per minute Morse code examination...."/27

10. Another approach taken in the petitions is to preserve the current five class structure by conversion of the Novice Class to a codeless class. John McCord, for example, recommends elimination of the telegraphy requirement for the Novice license./28 In addition to conversion of the Novice Class, Dennis and Linda Welch also suggest a merger of the Technician and General Classes./29 The SCATG recommends that the Novice Class be gradually replaced by a non-renewable codeless class that would "minimally disrupt the existing license structure to avoid disenfranchising current licensees. ... [t]he new license should avoid isolating the newcomer from the mainstream of amateur radio operators and operations while maintaining the incentive to upgrade and providing attractive privileges for the newcomer...."/30

11. Other petitions suggest major revisions to the license class structure. James Taylor states that prospective amateur operators "are put off by the present complex, layered structure of our hobby...." He suggests one all-purpose operator class./31 Alan Horowitz suggests "a no-code ham license, similar to Canada's license structure."/32 Michael Trahos, however, states that "[t]he Canadian no-code experience has clearly shown that creation of a no-code license class with examination requirements greater than that of the lowest available code license class fails to promote interest in, or insignificantly increases, the number of licensed amateur radio operators."/33 He suggests, instead, two new codeless classes./34 Bill Welsh believes that emission mode privileges should be earned "by passing written and on-the-air operating tests that are directly related to the desired additional emission/mode privilege being sought."/35 He suggests that all frequency segments now offered as incentives be eliminated./36

12. Operator privileges. The petitions generally concur that, as a minimum, a station control operator holding a codeless class of license be authorized all emission privileges on the 1.25 meter (m) and shorter wavelength bands. For the longer wavelength bands, however, there are several views, starting with James Taylor's recommendation that all possible privileges be authorized to the codeless class./37 Michael Trahos and SCATG recommend including the 6 m and 2 m bands./38 Burt Fisher recommends authorizing the 52-54 MHz segment in the 6 m band. He also recommends including the 2 m band, but

excluding emission F3E on that band./39 The ARRL recommends excluding operation on both the 6 m and 2 m bands./40 Dennis and Linda Welch,/41 David Stall,/42 and John McCord make recommendations similar to those of the ARRL. John McCord, however, suggests including digital type emission privileges on the 6 m and 2 m bands./43

13. The petitions recommend that the eligibility for the codeless class of license, like all amateur operator licenses, require the passing of a written examination. The ARRL states that the written examination should reflect the privileges to be earned and require a greater commitment than does the present Technician class written examination. It believes that the lessons learned from codeless license programs in other countries necessitate a significant written examination. The ARRL recommends, therefore, that a written examination for the codeless license be administered under the Volunteer Examiner Coordinator (VEC) system. The ARRL also recommends a 60 question written examination consisting of the current 55 question

```

written examination for the Technician Class Operator license, augmented by five additional questions related to the specific privileges afforded the codeless licensees. Two of the new questions would be concerned with the application and use of telegraphy and the remainder would be concerned with digital communication techniques./44 The SCATG states that the written examination should consist of 50 questions./45

14. The petitions also suggest names for a new codeless

class of license. The SCATG suggests "Apprentice."/46 Burt Fisher suggests "Novice-V."/47 Michael Trahos suggests "Novice-Plus" and "Technician-Plus."/48 David Stall suggests "Limited."/49 The ARRL states that its suggested name "Communicator," although "not exactly reflective of the type of license envisioned in the proposal... is, however, the most descriptive among those alternatives considered."/50

IV. PROPOSAL

15. We believe that the petitions have merit. Further, like the petitioners, we believe that this is a propitious time to propose the establishment of a codeless license, given the advances in electronic communications in the past few years. We propose, therefore, to establish a codeless class of amateur operator license, the Communicator Class. With respect to this proposed operator class, we have established three objectives. Our first objective is to offer an entry level license opportunity to all persons who find the telegraphy requirement a barrier to pursuing the purposes of the amateur service. Our view is best expressed by the statement of the ARRL that "the goal of the codeless amateur license is to bring such licensees into the 'mainstream' of the Amateur Radio Service, and to encourage them to upgrade their license class."/51 Our second objective is to propose a type of license that can be implemented quickly if a decision is made to proceed. Our third objective is to avoid any negative effect upon current licensees, upon the work of the volunteer examiners, or upon the Commission's workload or resources. To preclude any impact on our resources, it is imperative that our existing computer-aided application processing system be utilized "as is."/52 The proposed rule amendments are contained in the attached Appendix.

16. In proposed Sections 97.501 and 97.503(b)1), we would require that the applicant for a Communicator Class license pass a 60 question written examination, as requested by ARRL. In sum, there would be an expanded entry level examination and corresponding question pool. We concur with ARRL that the written examination for the Communicator Class license should correspond to the privileges for that class of license./53 The new question pool would be comprised of the questions from the two pools currently used in the Novice and Technician license examinations, and new questions as requested by ARRL./54 By incorporating existing questions, over 91 percent of the question pool for a Communicator Class license would already be available and would help facilitate a smooth transition./55

17. Operator license structure. In proposed Section 97.9. we would incorporate the Communicator Class in a simplified license structure containing four ascending steps: Communicator, General, Advanced, and Amateur Extra

Classes, Current Technician and Novice Class operator licenses would be grandfathered indefinitely. There would be no new licenses issued for those license classes, but existing licenses could be modified or renewed. This approach would meet the objectives we established in paragraph 15. Dennis and Linda Welch, John McCord, and SCATG suggested preserving the five-step ladder by eliminating the telegraphy examination requirement from the Novice class license. This approach deserves careful consideration by the amateur community because of its simplicity. We did not propose this approach because of its disadvantage of lowering the license qualification standards for the Novice operator class. As such, it may be unacceptable to the hundreds of thousands of amateur operators, including the 85.000 current Novice Class licensees, who qualified for the Novice license by passing a telegraphy examination. The Novice Class has operating privileges below 30 MHz, necessitating the need for a knowledge of telegraphy as described in paragraph 2.

18. For future licensees, the Communicator Class license would be the first step in the license structure instead of the Novice Class. Our premise is that most newcomers to the service, given the choice, would elect to qualify for the Communicator Class license rather than the Novice Class license. There would, therefore, no longer be a need for the Novice Class license. We particularly invite instructors, volunteer examiners (VEs). and VECs to submit comments on the validity of this premise, including factual information on the time and effort that would be required for persons to prepare for the proposed 60 question Communicator Class written examination as compared to the time and effort currently required for the Novice Class 30 question written examination and telegraphy examination.

19. Because the written examination for the Communicator Class license would be more comprehensive than that of the Technician Class license, the Communicator Class would also serve in the stead of the Technician Class for future licensees. Each step in the proposed four step structure provides recognition that the holder has significantly advanced his or her skills in both the communication and technical phases of the radio art./56 This structure could be rapidly implemented. The present license application processing system and license application form would continue to be used./57

20. Operator privileges. The proposed control operator privileges of the Communicator Class would generally be those suggested by the ARRL. The privileges would include all authorized emission types. The proposed transmitter power standard would be 200 watts peak envelope power. The licensee's station would be eligible for a Group D call sign./58 Stations with Communicator Class control operators would not be permitted to transmit on

the 2 m and 6 m bands. In view of ARRL's desire to bring the codeless class into the mainstream of the amateur service,/59 however, we particularly invite comment on the effect of excluding Communicator Class licensees from these two popular bands.

21. The ARRL stated that one premise for its petition

was that an accommodation should be made for codeless class licensees to upgrade their license class. It cited countries that have codeless licenses where the written examination tests the examinee's technical qualifications. The ARRL stated that amateur service societies in countries such as Australia, the Federal Republic of Germany, and Belgium report ongoing telegraphy activities among the codeless class licensees working to upgrade the license class./60 While the proposed Communicator Class privileges include telegraphy on the 1.25 meter and shorter wavelength bands, we recognize that telegraphy operation is more closely associated with the HF bands. The opportunity for newcomers to the amateur service actually to send and receive messages in the Morse code on small segments of the HF 80, 40, 15, and 10 meter bands is provided to the Novice and Technician Classes so that those operators can gain an appreciation of telegraphy and acquire the proficiency needed to pass the telegraphy examination for the General Class operator license. We specifically request comments, therefore, concerning the desirability of including the opportunity for Communicator Class licensees also to experience on-the-air telegraphy operation on the HF bands. In view of our obligation under the provisions of the international Radio Regulations,/61 if it is desired, only domestic communications on the HF bands would be authorized.

22. Under proposed Section 97.301(g), a Communicator Class licensee who passes, or otherwise receives credit for a telegraphy examination, would be authorized the additional privileges of the Technician Class./62 To avoid a license processing burden, however, the documentation of the passing of, or credit for, a telegraphy examination would be evidenced by the Certificate of Successful Completion of Examination (CSCE) issued by the administering VEs,/63 rather than by the issuance of a Technician Operator license. The indicator used by the Communicator Class for identification purposes would be AC./64 Under proposed Section 97.505(a)(1), VEs would be authorized to grant examination credit, evidenced by a CSCE, to a Communicator Class examinee for the slow speed telegraphy examination when the examinee holds a Novice Operator license./65 That combination, Communicator Class license and CSCE, would permit the Communicator Class licensee the same rights and privileges of the Technician Class operator. The VECs would provide listings, in paper or magnetic form, of the Communicator Class licensees who have been issued the CSCE.

23. Volunteer examiners. The instant proposal contains substantive changes in the amateur operator license examination procedure and the issuance of amateur operator licenses and CSCEs. All operator license examinations would be administered under the VEC system./66 The additional task of administering the Communicator Class license would be offset by the elimination of other tasks, including the discontinuance of the two examiner system for the Novice Class license./67 The coordination and oversight by the VECs provide more credible results than does the two examiner system. In the latter, examination administration errors are more common and cheating is a greater problem than in the VEC system. The task of administering new Technician Operator Class licenses would also be discontinued./68 The Novice and Technician written examinations would no longer be prepared and administered as separate examinations. The VEs and VECs, moreover, could be reimbursed for out-of-pocket costs incurred in connection with all examinations./69

V. CONCLUSION

24. We believe that this proposal would achieve the objectives set forth in paragraph 15 above. We seek comments, therefore, on the proposed revisions to Part 97 to establish a Communicator Class Operator license for the amateur service, as set forth in the attached Appendix.

VI. PROCEDURAL MATTERS

25. For purposes of this non-restricted notice and comment rule making proceeding, members of the public are advised that ex parte presentations are permitted except during the Sunshine Agenda period. See generally 47 C.F.R. 1.1206(a). The Sunshine Agenda period is the period of time which commences with the release of a public notice that a matter has been placed on the Sunshine Agenda and terminates when the Commission (1) releases the text of a decision or order in the matter; (2) issues a public notice stating that the matter has been deleted from the Sunshine Agenda; or (3) issues a public notice stating that the matter has been returned to the staff for further consideration, whichever occurs first. 47 C.F.R. 1.202(f). During the Sunshine Agenda period, no presentations, ex parte or otherwise, are permitted unless specifically requested by Commission or staff for the clarification or adduction of evidence or the resolution of issues in the proceeding. 47 C.F.R. 1.1203.

26. In general, an ex parte presentation is any presentation directed to the merits or outcome of the proceeding made to decision-making personnel which (1) if written, is not served on the parties to the proceeding, or (2), if oral, is made without advance notice to the parties to the proceeding and without opportunity for them to be present. 47 C.F.R. 1.1202(b). Any person who makes or submits a written ex parte presentation shall provide on the same day it is submitted two copies of same under separate cover to the Commission's Secretary for inclusion in the public record. The presentation (as well as any transmittal letter) must clearly indicate on its face the docket number of the particular proceeding to which it relates and the fact that two copies of it have been submitted to the Secretary, and must be labeled or captioned as an ex parte presentation. 47 C.F.R. 1.1206.

27. Any person who is making an oral ex parte presentation and presents data or arguments not already reflected in that person's written comments, memoranda, or other previous filings in that proceeding shall provide on the day of the oral presentation an original and one copy of a written memorandum to the Secretary (with a copy to the Commissioner or staff member involved) which summarizes the data and arguments. The memorandum (as well as any transmittal letter) must clearly indicate on its face the docket number of the particular proceeding

and the fact that an original and one copy of it have been submitted to the Secretary, and must be labeled or captioned as an ex parte presentation. 47 C.F.R. 1.1206.

28. Authority for issuance of this Notice is contained in Sections 4(i) and 303(l) and (r) of the Communications Act of 1934, as amended, 47 U.S.C. 154(i) and 303(l) and (r). Pursuant to applicable procedures set forth in Sections 1.415 and 1.419 of the Commission's Rules, 47 C.F.R. 1.415 and 1.419, interested parties may file comments on or before August 6, 1990, and reply comments on or before September 7, 1990. All relevant and timely comments will be considered by the Commission before final action is taken in this proceeding. To file formally in this proceeding, participants must file an original and four copies of all comments and reply comments. If participants want each Commissioner to receive a personal copy of their comments, an original and nine copies must be filed. Comments and reply comments must state the proceeding to which they relate (PR Docket Number). They should be sent to the Secretary, Federal Communications Commission, Washington, D.C. 20554. Comments and reply comments will be available for public inspection during regular business hours in the Dockets Reference Room (Room 239) of the Federal Communications Commission, 1919 M Street N.W., Washington, D.C. 20554.

29. In accordance with Section 605 of the Regulatory Flexibility Act of 1980. 5 U.S.C. 605, the Commission certifies that these rules would not, if promulgated, have a significant economic impact on a substantial number of small entities, because these entities may not use an amateur station to transmit any communication the purpose of which is to facilitate the business or commercial affairs of any party. See 47 C.F.R. 97.113(a). Moreover, the proposed rules would not require the use of or significantly enhance the sale of any additional amateur station apparatus.

30. The proposal contained herein has been analyzed

with respect to the Paperwork Reduction Act of 1980. 44 U.S.C. 3501 et seq., and found to increase the information collection burden which the Commission imposes on the public. This proposed increase in the information collection burden is subject to approval by the Office of Management and Budget as prescribed by the Act.

31. A copy of this Notice will be forwarded to the Chief Counsel for Advocacy of the Small Business Administration.

FEDERAL COMMUNICATIONS COMMISSION

Donna R. Searcy
Secretary

APPENDIX

Part 97 of Chapter I of Title 47 of the Code of Federal Regulation is proposed to be amended as follows:

1. The authority citation for Part 97 continues to read as follows:

Authority citation: 48 Stat. 1066, 1082, as amended; 47 U.S.C. 303. Interpret or apply 48 Stat. 1064-1068, 1081-1105, as amended; 47 U.S.C. 301-609, unless otherwise noted.

2. Section 97.9 is revised to read as follows:

97.9 Operator license.

(a) The classes of operator licenses are Communicator, General, Advanced, and Amateur Extra. There are also two grandfathered classes of operator licenses, Novice and Technician. An operator license authorizes the holder to be the control operator of a station with the privileges of the operator class specified on the license. The license document or a photocopy thereof must be in the personal possession of the licensee at all times when the person is the control operator of a station.

(b) A person holding a Communicator Class operator license and who holds a CSCE indicating that the person passed element 1(A), 1(B), or 1(C) is authorized to exercise the rights and privileges of the Technician Class for the duration of the license term and renewal thereof.

(c) A person holding a Novice, Technician, Communicator, General, or Advanced Class operator license who has properly filed with the FCC an application for a higher operator class that has not yet been acted upon, and who holds a CSCF indicating that the person passed the necessary examinations within the previous 365 days is authorized to exercise the rights and privileges of the higher operator class.

3. Section 97.17(a) is revised to read as follows:

97.17 Application for new license.

(a) Any qualified person is eligible to apply for an amateur service license. No new Novice or Technician Class operator licenses will be issued.

4. Section 97.119(e) is revised to read as follows:

97.119 Station identification.

(e) When the control operator is using privileges on the basis of holding a CSCE, an indicator must be included after the call sign as follows:

(1) AC for Communicator Class operator;
(2) AG for General Class operator;
(3) AA for Advanced Class operator; or
(4) AE for Amateur Extra Class operator.

5. Section 97.301(a) is revised and a new paragraph (g) is added to read as follows:

```

97.301 Authorized frequency bands.

(a) For a station having a control operator holding a Technician, Communicator, General, Advanced or Amateur Extra Class operator license:

Wavelength band	ITU Region I	lTU Region 2	ITU Region 3	Sharing requirements See 97.303, Paragraph:
VHF	MHz	MHz	MHz	
1.25m	---	222-225	---	(a),(b),(e)
UHF	MHz	MHz	MHz	
70 cm	430-440	420-450	420-450	(a),(b),(f)
33 cm	---	902-928	---	(a),(b),(g)
23 cm	1240-1300	1240-1300	1240-1300	(j)
13 cm	2300-2310	2300-2310	2300-2310	(a),(b),(j)
do	2390-2450	2390-2450	2390-2450	(a),(b),(j)
SHF	GHz	GHz	GHz	
9 cm	---	3.3-3.5	3.3-3.5	(a),(b),(k),(l)
5 cm	5.650-5.850	5.650-5.925	5.650-5.850	(a),(b),(m)
3 cm	10.00-10.50	10.00-10.50	10.00-10.50	(b),(c),(i),(n)
1.2 cm	24.00-24.25	24.00-24.25	24.00-24.25	(a),(b),(i),(o)
EHF	GHz	GHz	GHz	
6 mm	47.0-47.2	47.0-47.2	47.0-47.2	
4 mm	75.5-81.0	75.5-81.0	75.5-81.0	(b).(c),(h)
2.5 mm	119.98-120.02	119.98-120.02	119.98-120.02	(k),(p)
2 mm	142-149	142-149	142-149	(b),(c),(h),(k)
1 mm	241-250	241-250	241-250	(b),(c),(h),(q)

* * * * *

(g) For a station having a control operator holding a Technician, General, Advanced or Amateur Extra Class operator license:

Wavelength band	ITU Region 1	ITU Region 2	lTU Region 3	Sharing requirements See 97.303, Paragraph:
VHF	MHz	MHz	MHz	
6 m	---	50-54	50-54	(a)
2 m	144-146	144-148	144-148	(a)

6. Section 97.501 is revised to read as follows:

97.501 Qualifying for an amateur operator license.

An applicant must successfully pass an examination for the issuance of a new amateur operator license and for each change in operator class. Each applicant for the class of operator license specified below must pass, or otherwise receive examination credit for, the following examination elements.

(a) Amateur Extra Class operator: Element 1(C), and elements 3(A), 3(B), 4(A), and 4(B);
(b) Advanced Class operator: Element 1(B) or 1(C), and elements 3(A), 3(B), and 4(A);
(c) General Class operator: Element 1(B) or 1(C), and elements 3(A), and 3(B);
(d) Communicator Class operator: Element 3(A).

7. Paragraphs (b) and (c) of Section 97.503 are revised to read as follows:

97.503 Element standards.

(b) A written examination must be such as to prove that the examinee possesses the operational and technical qualifications required to perform properly the duties of an amateur service licensee. Each written examination must be comprised of a question set as follows:
(1) Element 3(A): 60 questions concerning the privileges of a Communicator Class operator license. The minimum passing score is 45 questions answered correctly.
(2) Element 3(B): 25 questions concerning the additional privileges of a General Class operator license. The minimum passing score is 19 questions answered correctly.
(3) Element 4(A): 50 questions concerning the additional privileges of an Advanced Class operator license. The minimum passing score is 37 questions answered correctly.
(4) Element 4(B): 40 questions concerning the additional privileges of an Amateur Extra Class operator license. The minimum passing score is 30 questions answered correctly.
(c) The topics and number of questions required in each question set are listed below for the appropriate examination element:

Topics	Element:			
	3	3	4	4
	(A)	(B)	(A)	(B)

(1) FCC rules for the amateur radio services	15	4	6	8
(2) Amateur station operating procedures	7	3	1	4
(3) Radio wave propagation characteristics of amateur service frequency bands	4	3	2	2
(4) Amateur radio practices	11	5	4	4
(5) Electrical principles as applied to amateur station equipment	6	2	10	6
(6) Amateur station equipment circuit

components	4	1	6	4
(7) Practical circuits employed in amateur station equipment	3	1	10	4
(8) Signals and emissions transmitted by amateur stations	4	2	6	4
(9) Amateur station antennas and feed lines	6	4	5	4

8. Section 97.505(a) is revised to read as follows:

97.505 Element credit.

(a) The administering VEs must give credit as specified below to an examinee holding any of the following documents:

(1) An unexpired (or within the renewal grace period) FCC-issued Novice Class operator license: Element 1(A) and the 30 written questions in Element 3(A) based upon

the material from the written examination passed for the Novice Class operator license.

(2) An unexpired (or within the renewal grace period) FCC-issued Communicator Class operator license: Element 3(A).

(3) An unexpired (or within the renewal grace period) FCC-issued Technician Class operator license: Element 3(A).

(4) An unexpired (or within the renewal grace period) FCC-issued Technician Class operator license issued before March 21, 1987: Elements 3(A) and 3(B).

(5) An unexpired (or within the renewal grace period) FCC-issued General Class operator license: Elements 1(B), 3(A), and 3(B).

(6) An unexpired (or within the renewal grace period) FCC-issued Advanced Class operator license: Elements 3(A), 3(B), and 4(A).

(7) A CSCE: Each element the CSCE indicates the examinee passed within the previous 365 days.

(8) An unexpired (or expired less than 5 years) FCC-issued commercial radiotelegraph operator license or permit: Element 1(C).

9. Section 97.507 is revised to read as follows:

97.507 Preparing an examination.

(a) Each telegraphy message and each written question set administered to an examinee must be prepared by a VE holding an FCC-issued Amateur Extra Class operator license. A telegraphy message or written question set, however, may also be prepared for the following elements by a VE holding an FCC-issued operator license of the Class indicated:

(1) Element 3(B): Advanced Class operator.
(2) Elements 1(A) and 3(A): Advanced or General Class operator.

(b) Each question set administered to an examinee must utilize questions taken from the applicable question pool.

(c) Each telegraphy message and each written question set administered to an examinee for a Communicator. General, Advanced or Amateur Extra Class operator license must be prepared, or obtained from a supplier, by the administering VEs according to instructions from the coordinating VEC.

(d) A telegraphy examination must consist of a message sent in the international Morse code at no less than the prescribed speed for a minimum of 5 minutes. The message must contain each required telegraphy character at least once. No message known to the examinee may be administered in a telegraphy examination. Each 5 letters of the alphabet must be counted as 1 word. Each numeral, punctuation mark and prosign must be counted as 2 letters of the alphabet.

10. In Section 97.511, the heading and the text are revised to read as follows:

97.511 Operator license examination.

(a) Each session where an examination is administered must be coordinated by a VEC. Each administering VE must be accredited by' the coordinating VEC.

(b) Each examination for a Communicator Class operator license must be administered by 3 administering VEs. each of whom must hold an FCC-issued Amateur Extra or Advanced Class operator license.

(c) Each examination for a General, Advanced or Amateur Extra Class operator license must be administered by 3 administering VEs, each of whom must hold an FCC-issued Amateur Extra Class operator license.

(d) The administering VEs must make a public announcement before administering an examination. The number of candidates at any examination may be limited.

(e) The administering VEs must issue a CSCE to an examinee who scores a passing grade on an examination element.

(f) Within 10 days of the administration of a successful examination, the administering VEs must submit the application to the coordinating VEC.

11. Section 97.513 is removed.

12. In Section 97.519, new paragraph (d) is added to read as follows:

97.519 Coordinating examination sessions.

(d) Each coordinating VEC must compile lists of Communicator Class operator licensees who have been issued a CSCE for Element 1(A), 1(B), or 1(C) during each calendar month. The VEC must forward a copy of the list to the Private Radio Bureau, FCC, Washington. DC 20554, by the 10th day following the end of the month.

13. Section 97.527 is amended by revising paragraph (a), removing paragraph (c) and redesignating paragraphs (d) (e) (f) and (g) as (c) (d) (e) and (f) to read as follows:

97.527 Reimbursement for expenses.

(a) VEs and VECs may be reimbursed by examinees for

out-of-pocket expenses incurred in preparing, processing, administering, or coordinating an examination.

FOOTNOTES

/1 The petitions were received from the American Radio Relay League, Inc. (ARRL) (RM-6995), Larry Ballentine (RM-6991), Clement Bourgeois, Jr. (RM-6988), Burt Fisher (RM-6989), Alan Horowitz (RM-6984), John M. McCord (RM-6993), the Space Coast Amateur Technical Group (SCATG) (RM-6986), David K. Stall (RM-6994), James E. Taylor (RM-6985), Michael C. Trahos (RM-6990), Dennis and Linda Welch (RM-2987), and Bill Welsh (RM-6992). Subsequent to the Public Notice listing of the foregoing petitions, two additional petitions addressing the same matter were received from Larry Garens and Philip Howard. These petitions are included in the record of this notice and comment proceeding and will be given full consideration prior to a final determination in this matter.

/2 See No. 53 of the International Telecommunication Union Radio Regulations (Geneva, 1979) (hereafter Radio Regulations). See also 47 U.S.C. 153(q).

/3 See No. 2735 of the Radio Regulations.

/4 The license classes are, in ascending steps, Novice, Technician, General, Advanced and Amateur Extra.

/5 The examinations cover three levels of telegraphy skill. They are 5, 13, and 20 words-per-minute. The examinee must also pass certain written examination elements, depending upon the operator license class sought. See Sections 97.501 and 97.503 of the Commission's Rules, 47 C.F.R. 97.501 and 97.503.

/6 Notice of Proposed Rule Making, Docket No. 20282, 39 Fed. Reg. 44042 (1974).

/47 RM-6989 at 1.

/48 RM-6990 at 20.

/49 RM-6994 at 1.

/50 RM-6995 at 17.

/51 RM-6995 at 19.

/52 The sixth license class designation is "Communicator."

/53 A written examination must be designed to demonstrate that the examinee has the operational and technical qualifications required to perform properly the duties of an amateur service licensee in accordance with the privileges authorized by the class of operator license sought. See 47 U.S.C. 303(l)(1) and 47 C.F.R. 97.503(b).

/54 Section 97.523, 47 C.F.R. 97.523, requires all VECs to cooperate in maintaining one question pool for each written examination element. Each pool must contain at least 10 times the number of questions required for a single examination.

/55 The current Technician Class question pool consists of 250 questions. There are currently 300 questions in the Novice Class question pool. An additional 50 questions would be added, giving the proposed Communicator Class question pool a total of 600 questions.

/56 See Section 97.1(c). 47 C.F.R. 97.1(c).

/57 Until a revised FCC FORM 610 becomes available, the administering VEs would write in certain information on the current form in the case of an application for a Communicator Operator license. We would furnish information to the VECs for temporary use of the current form, if we decide to proceed with the Communicator Class license.

/58 The computer-aided application processing system selects a new call sign from four basic groupings for assignment to an amateur station. Each call sign is sequentially selected from an alphabetized regional-group list that corresponds to the licensee's class of operator license and mailing address.

/59 RM-6995 at 19.

/60 RM-6995 at 14.

/61 See Radio Regulations, Nos. 2735, and 2736.

/62 The additional privileges include RTTY and data emissions and phone emissions J3E and R3E in a segment of the 10 meter band, and all authorized emissions in the 2 and 6 meter bands, See 97.301 and 97.303.

/63 A Certificate of Successful Completion of Examination is now issued by VEs. See Section 97.511(e), 47 C.F.R. 97.511(e).

/64 Section 97.119(e) requires that an indicator must be included after the call sign whenever the control operator is using privileges based on holding a CSCE. The indicator AC is proposed for the Communicator Class.

/65 Currently, Section 97.505(a)(2), 47 C.F.R. 97.505(a)(2), requires VEs to give credit to an examinee holding a certificate of successful examination (CSCE) indicating the examination was passed within the previous 365 days. Currently, Section 97.9(b), 47 C.F.R. 97.9(b). authorizes a licensee holding a CSCE indicating that he or she completed the necessary examinations within the previous 365 days to exercise the rights and privileges of the higher operator class. The time limitation that would apply to the use of a CSCE in conjunction with the Communicator Class license authorizing the rights and privileges of the Technician Class would be the duration of the license term and renewal thereof.

/66 Eighteen organizations function as VECs. They accredit VEs, coordinate examination sessions, maintain the question pools, provide instructions to VEs, review and forward completed license application forms to the Commission for processing. Some 50,000 examinations are administered annually under the VEC system.

/67 Some 18,000 to 20,000 persons qualify for a Novice Operator Class license annually. The examinations are administered by two General, Advanced, or Amateur Extra Operator Class licensees selected by the examinee.

/68 Some 10,000 to 15,000 persons qualify for the Technician Operator Class license annually.

/69 Currently, VEs and VEC may only be reimbursed by examinees for expenses incurred in preparing, processing. administering or coordinating an examination for a Technician, General, Advanced, or Amateur Extra Class Operator license. See 47 U.S.C. 154(f)(4)(J) and 47 C.F.R. 97.527.

I called him one day to pick up V31 as a prefix and asked him to repeat his call when he answered since he was kinda weak to me. He refused, said no contact and launched into a big spiel about running "a tight ship" there.

The incident really made me angry. So angry that I sold my TS-820S a few days later. You all can have HF! I have never seen so many rude and crude operators anywhere except on CB. Sorry, fellas, I call 'em as I see 'em.

Forget 10 meters, it's already doomed.

Just my opinion.

My cross refences manual has an ECG/NTE 160 transistor as the equivalent.
It is in fact a Germanium PNP RF-IF amp. When I was located in London
I use to call RS and they would cross the ECG/NTE part to what ever they
had in stock (and sometimes the had the ECG/Philips actual part). Hope
this helps.

If you are into building, the RadioKit 20M compact CW transceiver went together rather easily for me. It is based on the article in the May 1987 issue of Ham Radio magazine. The kit includes the cabinet, PC boards, and all of the components and associated hardware. The only part that is not provided is the main VFO dial which RadioKit does not provide, and they inform you of that in their catalog. Since there is not a easy source for this dial (as RadioKit must have also discovered), I made my own.

One main PC board and a smaller PA board are the bulk of the electrical work; you do need to punch out your own front and rear panels. This is not a "Heathkit" in terms of documentation. RadioKit does provide a reprint of the magazine article.

Once together, I did have trouble getting the adjustments correct until I borrowed a spectrum analyzer! I highly recommend obtaining one for the oscillator adjustments, and especially when checking for spurious outputs. The receiver is based on 1496 mixers and 1350 IF amp and is a superhet with a 9 MHz IF. Although I haven't made any measurements on sensitivity, it seems to be quite good.

I am not associated with RadioKit -- I just had a lot of fun building this kit!

I've worked V31BB a number of times on 10 meter FM and UUSB and he's always given me a good report. I've tryed to QSL him direct but still no response. I listened to part of the MFJ Junk-Net he was running and from I gather he's pissed off at his Ameritron Linear amplifier which I assume is made by MFJ.

I have noticed (for some time now) a sweeping carrier passing through the HF bands. It appears both in the amateur HF bands and other HF frequencies as well. It sounds just like someone spotting their VFO as they spin the VFO dail up or down the band. At first I assumed this was someone with bad operating practices but after I noticed it on the non-ham portions of the HF band I figured it was some military station with annoying operating practices.

I now belive that none of the above explanations apply. I think this sweeping carrier is some sort

of HF propogation sounder. It probably is finding
the MUF and collecting data relating to HF
propogation vs. frequency vs. time. If this is
true how can the FCC license such an obnoixous
thing?

Anybody have any explanations?
Thanks in advance,
C. Thompson WB4HVD

Does anyone have any leads on an RCA 4065 tube? Please e-mail any replies
if possible.

This does not have any direct connection to Ham-

As part of my research, I need a high voltage (>300 volts peak to peak) RF (1-50 MHz) source to drive a reactive load that varies with time. The total current that I need for the experiment (and therefore the wattage) is quite small (<1W), but I need an ideal voltage source (the output voltage must remain constant during the experiment ; when the impedance of the load changes).

I was told that an RF transmitter is the only way to go. Are there any commercially available equipment that may do the job?

I have an RF signal generator which produces 30 volts peak to peak into a 50 ohm load . Could I get/build an amp that could produce 300 volts peak to peak from this?

Any suggestions will be greatly appreciated.

Please E-Mail all responses to me , I dont read this newsgroup regularly.

Thanks in Advance!

Suresh

I advise you not to buy Everex products.

I just recently got a Seagate ST-4096 hard disk which was repackaged by Everex. The documentation which came with the disk was incorrect. The software which came with the disk has serious bugs.

Following the documentation written by Everex exactly, I was unable to get the drive to work. After calling the vendor, and talking to their technical support people, I learned that the Everex documentation is wrong. They give faulty information on how to configure the jumpers on disk drives. (The correct information will follow later.) After following the instructions from the vendor tech support people, the disk worked. According to the vendor, Everex admits that their documentation is incorrect, but they won't fix it.
Note: The "drive select" jumpers should be set as follows:
If you have a cable with a twist in it, the DS jumpers on BOTH disks should be set to the second addressable drive. For hard disks, this is drive 2 because addressing starts with DS1; for floppy drives, this is drive 1 because addressing starts with DS0. The drive on the end of the cable with the twist will be the first of the two drives (eg. A:) and the other drive will be the second of the two drives (eg. B:).
If you have a cable without a twist in it, and a single disk drive, the DS jumper should be set to the first addressable drive. For hard disks, this is DS1; for floppy drives this is DS0.

Using the software provided by Everex led to other working systems in my computer becoming non-functional. After calling the vendor, and talking to their technical support people, I learned that Everex admits that their software does not work. The vendor agreed to ship me a copy of Seagate's software. I haven't received it yet, but I expect it to work just fine.
Note: The specific problem I had was: when using the everex device driver "evdisk.sys", my 720k B: drive would not function

correctly. You could put in a disk, do a "dir" command, switch disks, do another "dir" command, and see the directory of the first disk. You could "cd" to directories on the first disk which did not exist on the second disk which is actually in the drive. The only (hokey) way out of this problem was to force a drive read fault, to get the "Abort, Retry, or Ignore?" message. This is definitely a bug, and not a feature.
(If the evdisk.sys device driver is not used, then 50M of the 80M disk is wasted under any version of DOS previous to 4.0.)

Rule 1   Don't buy Everex products.

Rule 2   Specify to vendors that you won't accept Everex products.

Rule 3   If you buy something, and it turns out to be an Everex product, see rule 1 and rule 2. Return it.

Maybe this belongs in rec.radio.sw, but since my site doesn't subscribe, I'm posting here. Please forgive me.

I bought the Radio Shlock DX-440 about 1 year ago and I've been pretty pleased with it up until last weekend. After listening to a clear SW station, I hit scan and it never found another station. FM still works fine and the scan function still searches properly, but no AM/SW stations are being detected, even when programmed directly. This includes SSB and CW stations with BFO in or out. So basically I'm down to an FM receiver of which I already have too many.

I've written to the Shlock to get schematics for the DX-440, but in the meantime, has anyone else out there experienced this same problem with this radio? Is there a quick fix someone might suggest? Does the radio contain CMOS or any other ESD sensitive parts? FYI, I am an EE and I can handle a soldering iron, so if anyone can point me to the AM detection stage in this thing, I'm willing to give it a shot. The warranty was only 90 days and I didn't opt for the extended version. Could it be something as simple as a single IC chip in a socket? . . . Naah, not if Murphy has anything to say about it!

While I'm at it: the cheapos at RS conveniently plugged the tape out hole on this model to bring the cost <$200. (*&%#@!?ARGH*(#@!) The solder pads are on the board (I've seen them). So what type of jack can be put here to finish RS's job, and where can I buy it? Anyone out there with the Sangean model, etc.? The radios are all the same except for the jack. If I just knew if it was an RCA phono jack and I could find a source for the part . . .

Any help would be greatly appreciated, for whatever my eternal gratitude is worth. E-mail or post (sometimes my e-mail bounces). And, BTW, I recently joined the ranks of amateur extra class. YAY!

>
> I am hoping to give her a light portable CB which she can use to summon help from home (my dad) and it should have a range of 2.5 to 3 miles (reliably).

In the February 1990 "Monitoring Times", there is an annoucement of a new service granted by the FCC, Personal Emergency Locator Transmitter Service (PELTS). It is to use 3 Watt radios in the 220 Mhz band with voice and homing capablity. The intended use for emergencys for hikers, skiers, and mountain climbers in wilderness areas. The article was short on details, so it is unclear whether the equipment will be allowed outside wilderness areas, and if the frequencys are shared.

One reason for the speed that this was created, was that aircraft ELT tranmitters were being (ab)used for this application.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Giovanni Moretti <GMoretti@massey.ac.nz> asks about a log amplifier over 60 dB at 10.7 MHz for a spectrum analyser.

John Whitmore <whit@milton.acs.washington.edu> suggests the classic National Semi appnotes that exploit the logarithmic I/V relationship in a diode. John Wieczorek <johnw@watnext.waterloo.edu> suggests an ICL8048; this part uses the same approach. Both of these approaches are appropriate if the logarithm of a low frequency signal, perhaps up to 10 kHz, is required. However the problem in a spectrum analyser is to get such a wide dynamic range through the IF amplifiers unscathed; IF amplifiers are just not capable of 60 dB, so the log operation must be performed at IF frequencies, not after detection.

As Michael Katzmann <michael@fe2o3.UUCP> suggests, Plessey is the place to look. They have a series of parts starting (SL521, 523, 1521, 1522, 1523) that are specifically designed as logarithmic IF amplifiers (for radar, in fact). In October 1980 these were documented in Radar and Radio Communications IC Handbook, but they're not in the March 1987 Radio Telecoms IC Handbook and I don't have the latest books.

STRANGE HF SIGNALS MAY BE PROPAGATION SOUNDERS

by Bob Parnass, AJ9S

Many scanner and shortwave listeners are curious by nature, and want to know the identity of stations they hear. Pirate broadcast stations have a cult following, as do "spy numbers" and military transmissions.

But, some signals seem to defy explanation. They are neither voice nor data. What are those clicks, tweets, and bursts one hears on the shortwave bands? Perhaps you stumbled upon signals from over the horizon radar, or even an RF induction heating oven. There is another source of these puzzling signals -- your receiver may have intercepted a sounder system used for propagational studies.

A recently released U. S. Navy report gives us a peek at several such radio sweeper systems: HF Maximum Usable Frequency (MUF) Model Uncertainty Assessment, Technical report 1184, by T. N. Roy and D. B. Sailors. June 1987. Naval Ocean Systems Center, San Diego, CA.

Basically, a sounder system consists of a transmitter that emits signals sequentially on several frequencies, and a distant receiver which is programmed to follow the transmitter frequency and measure the signal strength at each channel.

Navy Tactical Sounder System

The Navy has used a system of several shore-based AN/FPT-11 (XN-1) sounder transmitters and shipboard and land based AN/UPR-2 receivers to determine propagation conditions. Known as the Navy Tactical Sounder System (NTSS), the FPT-11 transmits a double, biphase pulse sequence every minute on each of 80 frequencies between 2 and 32 MHz. The 80 frequencies are spaced in 100 kHz increments between 2 and 4 MHz, 200 kHz increments between 4 and 8 MHz, 400 kHz increments between 8 and 16 MHz, and 800 kHz increments between 16 and 32 MHz.

Both receivers and transmitters are synchronized to WWV so the receivers can follow the transmitter frequency sequence.

Granger Model 900 Sounder

The Stanford Research Institute has used a different system to study propagation. Their equipment consists of Granger Associates Model 900 sounders, which cover the 4 to 64 MHz range in four bands of 40 linearly spaced channels each. The Granger sounders are high power, and transmit 30 kW peak pulses of 0.1 ms or 1.0 ms. The scan sequence takes 29 seconds to complete, and is repeated every 20 minutes.

A search of FCC records shows SRI may also be using linear sweepers. SRI was granted license KA2XNH as an experimental contract station to fullfull U.S. Navy contract N00014-83-C-0267. This license permits a 50 watt SRI transmitter to sweep the 2-32 MHz band in 1 Hz increments not more than 3 times per hour at a sweep rate of not less than 5 minutes sweep for the entire band.

Other Systems

Another sounder system consists of a device called a C-3 iosonde, which transmits 0.1 ms pulses and is swept linearly between 2 and 25 MHz.

The BR Communications HF Chirpsounder System takes 5 minutes to sweep between 2 and 30 MHz, and the sweep is repeated every 15 minutes.

Sights and Sounds

It's tough to follow frequency agile signals using only shortwave receiver. Connecting a panoramic display (panadaptor) makes it easier to identify sounders. One can actually see the sweeper signals moving up the band.

Some days back, there was a posting from a military radio collector, I believe in Europe, who wanted info on the Vietnam-era military radios PRC-25 and PRC-70. I got out my 1981 Jane's Military Communications and herewith the enclosed info. (By the way, I recommend anyone interested in military surplus electronics see if they can get ahold of copies of this publication. It is insanely overpriced when new, like all the Jane's books, at $150 or something idiotic like that. However, remaindered copies show up in mail-order book catalogs now and then. I have bought a couple issues of the Military Communications books for $15 [and I think I saw one being closed out for $10 *after* I paid $15 :-(] from Publishers Central Bureau. The Infantry Weapons back issues tend to go for about $50, and other series are somewhere in-between. "Jane's Shipping Containers" is always very cheap, but I have never figured out who would ever want one! :-) I don't know if there is a European version of PCB; maybe each language-area has their own remaindered-book mail-order house? Any UK readers know of good English-language remaindered- and used-book dealers who would do mail-order with the US at reasonable rates? For the US readers who do not already get 4 catalogs from PCB in the mail each month, here's their address: Publishers Central Bureau, One Champion

Ave., Avenel, NJ 07131.)

Here's the radio data:

AN/PRC-25 VHF/FM MANPACK TRANSCEIVER

Platoon and company level communications gear. Developed '59-'60; produced from '61 on. No longer in production as of the 1980 date of this publication. Also came in vehicle-mounted and vehicle/portable versions.

2 bands: 30-52.95 MHz and 53-75.95 MHz

920 channels, 50 kHz separation

2 Whip antennae -- 36" and 129" long (could also be hooked to a ground-plane)

Transmitter power 1 - 1.5 Watts; Weight = 24 lbs. (Wow! You really get a lot of output for lugging around this beast! :-)
Powered by 12.5V battery (type unspecified).
Dimensions: 11" high, 4" wide, 11" long (I would interchange some of these based on the picture. What they call "wide" I would call either "high" or "deep", depending how you sit the thing.)

AN/PRC-70

Developed Aug '64, in production from '71 through the date of the book ('80).

2 - 76 MHz in USB, AM, CW, & FSK
30 - 76 MHz in FM

Transmitter power: SSB = 30W PEP; FM, FSK, CW = 30W; AM = "7.5W Carrier" (whatever that means)
Weight 20 lb 8 oz (*less* battery case) [No power-requirement info given]

Dimensions: 4" high, 13" wide, 12" long

End of info

Looking thru this brings back memories of trying to DX with an AN/GRC-106 HF receiver part of the Tx/Rx combo at Nha Trang in '72. Lousy receiver, as I recall, but maybe it was the antenna... That radio has individual knobs for tuning each digit and bandscanning was really tedious! About a three-handed job... For my own radio, I had this wretched Allied multi-band job and couldn't get much more than the DW southeast-Asian relay and a few other regional stations. Boy, I wish I could slip back in time and give me the Sonys I have now then!

Regards, Will

>

And I advise you not to take the advice of someone who doesn't know which group to post to.

Yes I know he did follow-up to comp.sys.ibm.pc but that only means that those who read one of the above groups but not c.s.i.p will only see the posting of one person without seeing balancing viewpoints from others. If you are in that category then you should either completely ignore Kenneth's rantings or else subscribe to c.s.i.p. to read the whole story.

BTW: I have been dealing with Everex for years without having the problems that Kenneth seems to be having. But then I know how to connect a hard drive. Maybe Kenneth should stick to buying complete systems.

Follow-ups to comp.sys.ibm.pc

Brian Shiratsuki mentioned the Kantronics monobanders. As an ex-owner of one, let me make a few comments...

When I saw these they looked like an excellent deal. I tried one out- a 10M model- at a local store and was impressed with the quality and performance. However...

Some months later I bought one from a dealer at a swap at a good price; he had 10 and 15M units for about $220. The unit doesn't come with a noise blanker as standard (!), so I called Kantronics to see if I could order one. Surprise. Kantronics no longer selss these. They sold out their entire lot to various dealers at a close-out price. They have no parts, no manuals and no service info. The outfit they recommended I talk to about service says *they* don't have manuals either. A call back to Kantronics recommended I get get touch with the manufacturer, Tokyo High Power....in Tokyo.

A nice box, but with very poor support. Kantronics is to be lauded for trying to sell it, but roundly castigated for dumping support so quickly. I don't think I'll be doing business with them again soon. I swapped my unit to a friend (with full warnings). He's reasonably happy with it.

I'm just getting into shortwave radio an have a question or two...

I'm trying to tune various HF weather FAX stations with varying degrees of luck. I'm a pilot and the ability to receive up-to-date weather charts via radio FAX is what got me into SW in the first place. I have a Yaesu FRG-8800 receiver, going into a Kantronics KAM TNC to a 'puter for storage/display. I've been able to pick up the Norfolk station on 8.080MHZ and make pictures.

However, I wanted to hook up a 'scope to get the tuning for the KAM spot-on. Everything I've read says that, using the WEFAX FSK format, I should see 1500HZ for a mark and 2300HZ for a space signal. In between pictures the transmitter supposedly sends a space signal continuously. If I tune to 8.078.3MHZ on the FRG-8800 and then adjust the fine tuning for 2300HZ during the time the transmitter should be sending out a constant space signal the Kantronics shows a mark signal! Moreover, using said calibration produces no recognizable picture. If I instead adjust so that the receiver is putting out 1500HZ during the space transmission, the Kantronics indicates a space signal is being received (which is what it is supposed to indicate at 2300HZ) and the ensuing picture is normal.

Is there something I'm missing? Note that I am looking right at the audio output of the receiver, not the Kantronic's output. Am I actually seeing the RF carrier and mistaking it for the modem signals? I'm tuning 800HZ below the published frequencies, USB, btw.

Also, any good public-domain IBM-PC FAX programs?

One program that we(the local Amateur Auxiliary) are putting on for
anyone that is interested is a combo program where we talk about
the Amateur Auxiliary(OO's) and also talk about DF techniques.
The DFing part seems to be a real popular topic. The meetings
seem to run a bit long because there are usually so many questions.

Try contacting your local OO Co-ordinator(get his name from your
ARRL Section Manager) and maybe he can help you find a speaker.

In my area, there are a couple of linked voice repeater systems and several packet networks. The repeaters are linked on VHF and UHF with conventional FM tx/rx. The audio quality is OK if there is only one hop between the originating and receiving repeaters, but gets very poor if the repeaters are at opposite ends of the state.

On packet, the situation is not much better, now using 1200bps dedicated uhf backbone and/or vhf frequencies which are shared with the node users. To communicate with another station a few nodes away, it may take minutes for each packet to reach its destinition.

ISDN (Integrated Services Digital Network), is a new network protocol which aims to handle both voice and data (including X.25). Hardware (and probably software) are or will be available to facilitate an ISDN. It seems to me that ISDN running over a few microwave links would solve both of our linked repeater and packet problems. This is something the Amateur community should be on the leading edge of.

Does anyone know of any Amateur experiments planned or underway involving ISDN? Please reply to me - any replies, I'll summarize to the net.

Can any of you engineering types give me some idea of how much a satellite receive station (dish and electronics) costs for a radio broadcast station? We are interested in getting one for our FM broadcast station.

Thanks for your help.

Bruce

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

=========
SpaceNews
=========

MONDAY FEBRUARY 26, 1990

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world on UseNet and Amateur Packet Radio. It is available for UNLIMITED distribution.

* SAREX-2 TESTING CONTINUES *
=============================
Last week, the Shuttle Amateur Radio Experiment #2 (SAREX-2) packet radio station underwent extensive testing at the Marshall Space Flight Center in Huntsville, AL according AMSAT Area Coordinator Ed Stluka (W4QAU). This testing was being perfomed in conjuction with the training of STS-35 Payload Specialist Ron Parise (WA4SIR) in the use of the ASTRO-1 experiment which will be primary payload on that shuttle mission. The primary payload, ASTRO-1, will be used to conduct a number of astronomical experiments. During the several days of testing this week, radio amateurs in the Huntsville area were invited to connect to WA4SIR and to receive a QSO number.

This special packet radio station flying on STS-35 on May 9, 1990 will give each radio amateur who connects to WA4SIR a QSO number confirming their contact. When the connecting station sends their QSL card in with this contact number, they will receive back a beautiful QSL card commemorating this HAM IN SPACE shuttle flight. The SAREX-2 packet radio station consist of a Motorola 2M FM H/T with 5 watts ouput, a Heathkit HK-21 TNC-2, and a GRiD laptop computer that has a 40 MB hard disk drive to store the calls of all the stations connecting to WA4SIR during the nine day mission. The specially written software which will be running the SAREX-2 packet station is designed to allow for completely unattended operation and logging of the calls of all connecting stations. It will also prevent duplicate QSO numbers being sent! Although no digipeating will be allowed through SAREX-2, connecting to this packet station will be like any terrestrial packet contact. Just use your

TNC along with your 2m tranceiver, and everything else is the same. After you have connected and received your QSL number from WA4SIR, on subsequent orbits you can watch for the SAREX-2 message beacons being sent periodically. The message beacons will contain information about the flight of STS-35 and other interesting items.

Look for more information about the SAREX-2 mission in AMSAT News Service (ANS) bulletins and on AMSAT HF/VHF nets in the next couple of months. For more specific information about the ASTRO-1 payload, contact the SPACELINK BBS at (205) 895-0028.

SpaceNews

MONDAY MARCH 5, 1990

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world on UseNet and Amateur Packet Radio. It is available for UNLIMITED worldwide distribution.

* SHUTTLE NEWS *

Phil (KA9Q) heard UHF air-to-ground communications during the launch of shuttle ATLANTIS on mission STS-36. Phil copied a total of four very brief transmissions, all on a frequency of 259.7 MHz. The first transmission was heard at his home in New Jersey at about 02:59:30 AM EST shortly after launch. The last transmission heard at 02:59:30 EST clearly reported "APU shutdown on time".

* UoSAT-OSCAR-15 *

Experiments are under way using a large (150ft) antenna at Stanford (SRI-USA) to attempt to detect very low level signals leaking from the UoSAT-4 on-board uplink receiver local oscillators. If the spacecraft power systems are still functioning, then these signals should always be present since the receivers cannot be switched off. However, these leakage signals are deliberately minimised during the design of the satellite and so they are very weak (-60 dBm = one thousand, millionth of a watt or the equivalent to looking for a single xmas tree light in Australia!). The experiments at Stanford are therefore very demanding: it will only be possible to detect the signals from the background noise using sophisticated off-line FFT signal processing, and a one second error in antenna tracking time may miss the satellite altogether!

de G3YJO

[Story via OSCAR-11]

* BURAN NEWS *

The reusable Soviet space shuttle "BURAN", lying idle since its maiden flight a year ago is to undertake its next mission in 1991. The Soviet Union's chief rocket designer, Yuri Semyonov, told Soviet television recently, that Buran is scheduled to make an unmanned flight in the first half of 1991. A manned mission is expected to follow a year later. Long range plans call for Buran to dock with the orbiting station Mir, with the possibility of cosmonauts moving between the two to simulate a rescue operation.

* DX CORNER *

SpaceNews is available for unlimited, worldwide distribution. I'd like to personally thank ALL those who take the time to re-distribute SpaceNews on Amateur Packet Radio, telephone BBSs, and other networks. Your efforts are greatly appreciated by many people around the world.

Here is an example of one of the many mail messages I receive from those who read and enjoy receiving SpaceNews in distant places.

From Amateur Packet Radio, the following message was recently received from Germany:

```
 Msg# TSP  Size To     @ BBS  From    Date  Time Bid
 6307 PN    779 KD2BD         DL3BCH 900227 0747
Subject: to bbs: @NN2Z

Hello John.  I've just received 2
issues of SpaceNews - amazingly!
One of the only interesting bulletins
in my BBS, hihi. It was delivered by
Mario HB9RZJ@HB9AC.  Please continue if
possible. Mni tnx de Dieter DL3BCH @
DB0BQ (by the way: especially
interested in Voyager)
```

===

(Mario, could you please continue to supply the DB0BQ PBBS with SpaceNews? Thanks! de John, KD2BD)

I have my TS-440 hooked to my PK-232 via ACC2. Yes, I use the mike mute lead also. Drive the 440 PTT line AND mike mute lines with the PK-232 PTT output thru 2 switching diodes. Everything else is a direct connect.

Only 1 thing - the 440 wants a little higher audio level than the PK232 puts out, so the 440's mic gain (which works normally when feeding ACC2) needs to be turned up to about 50% for proper levels (note - for voice operation, my mike gain is set at about 25%).

Be careful soldering the 13 pin DIN connector - the plastic melts at low temps and the pins move around.

Greetings.
I am not a ham radio operator but it was recommended by a friend who is
one that I post a note here to try and get some info.
The situation is that I want to get a few (2-5) approx. three watt transcivers
with two or three channels for use at summer camp, as such they need to be
portable (where portable is defined as under 5 lbs.).
The problem with walkie-talkies is the ones I have found (at Radio Shack)
are too expensive. What I would like to know is...
1. Who sells walkie talkies cheaper than Radio Shack ($50 for 3 watt, 3 channel rig)
1. Is there some clearinghouse of "used but working" equipment I could get?
2. Is there some clearinghouse of not-working-but-fixable equipment?
3. Is there some book/magazine/manual that would tell me how to build such things?
4. Are CB's a reasonable option?

I do not read this board so please e-mail your responses to...
Bitnet   : GOTT@WISHEP
  or
Internet : GOTT@WISHEP.PHYSICS.WISC.EDU

Thanks in advance.

copied from packet
From: kd6th@kd6th.nj.usa (reqfil)
Message-ID: <19567@KD6TH>

INFORMATION ON THE HR2510 10 METER RADIO

1: THE HR2510 USES A DRIVER AND FINAL IN CONJUCTION TO GIVING YOU FULL 25 WATTS ON SSB.

2: THE DRIVER IN THE HR2510 IS COMPLETELY INTERCHANGEABLE WITH THE FINALS FOUND IN MOST RADIOS LIKE COBRA(2000GTL) AND THE UNIDEN (710E) AND IT CAN HANDLE UP TO 20 WATTS OF POWER. THE DRIVER IN THE HR2510 IS (2SC2166).

3: THE FINAL IN THE HR2510 IS A (MRF477) IT CAN HANDLE ABOUT 50 WATTS OF POWER. THIS IS A FURTHER INDICATION THAT THE RADIO WAS BUILT FOR POWER.

4: THE HR2510 HAS (AN612) BALANCE MODULATOR WHICH IS THE SAME FOUND IN A COBRA (148GTL) CB RADIO.

5: THE HR2510 USES A (10 MHZ I.F.) LIKE THE COBRA (146GTL) CB RADIO. AS A RESULT, THE RECEIVE IS VERY SIMILAR TO THE 146GTL CB RADIO.

6: THE HR2510 INSTEAD OF USING COILS, LIKE THE JACKSON RADIOS. thE HR2510 UTILIZES A WIDE - BAND TOROIDAL TRANSFORMER AT OUTPUTS TO ELIMINATE TUNING AND GET THE WIDE BANDWIDTHS NEEDED TO OPERATE THE (26 MHZ TO 30 MHZ).

EXPANDED FREQUENCY COVERAGE FOR THE UNIDEN HR2510

THIS RADIO COVERS A FULL 26-30 MHZ WITH A SIMPLE 10-MINUTE CIRCUIT CHANGE. NO FURTHER REALIGNMENT IS EVEN NEEDED, SINCE IT USES BROADBAND TUNING AND WAS DESIGNED TO COVER ALL THIS RANGE IN THE FIRST PLACE.

PRODCEDURE:

1: LOCATE PINS 34 AND 35 OF THE MAIN UP CHIP IC315. (CALLED "UC1201A", UC117", ETC.) THIS IS THE LARGEST CHIP ON THE SYNTHESIZER BOARD, PB121BB.

2: THESE PINS ARE GROUNDED ON THE HR2510 , BUT ARE TIED HIGH (5.0 VDC) ON THE EUROPEAN MODELS LIKE THE PRESIDENT LIINCOLN. ALL THATS REQUIRED IS TO BREAK THE GROUNDING PC TRACE AND TIE THEM INSTEAD TO A +5.0 VDC SOURCE THROUGH A PULLUP RESISTOR.

```
3: ON THE SOLDER SIDE OF THE SYNTHESIZER PCB, YOULL NOTICE THAT PIN 34 AND
35 ARE SOLDERED TOGETHER AND ARE CONNECTED TO THE MAIN GROUND FOIL. USING
A RAZOR BLADE OR EXACTO KNIFE, CUT THE FOIL AT A NARROW SPOT TO BREAK THIS
CONNECTION.

4: NOW NOTICE THAT THE LEFT-MOST PIN OF PULLUP RESISTOR PACK RR301 IS UNUSED
AND GOES TO AN ISOLATED ISLAND FOIL PAD.(HOW COINCIDENTAL!) JUST TACK A SMALL
JUMBER WIRE BETWEEN THIS PIN OF RR301 AND THE PAD OF IC315 PINS 34 AND 35, AND
YOU'LL BE IN BUSINESS!
     ----------------------------------------------------------------
OK !
----------------------------------------------------------------------
YOU NOW HAVE A RADIO USEFUL NOT ONLY FOR 10 METER HAM OPERATION, BUT ALSO FOR
LISTENING* TO THE KIND OF ROAD INFORMATION AND EMERGENCIES FOR WHICH CB HAS
PROVEN ITSELF REPEATEDLY. THE INDICATED COVERAGE ON THE FRONT PANEL WILL BE:

*don't transmit, this isn't a type accepted radio!

BAND A = 28.000 TO 28.490 MHZ
BAND E = 26.000 TO 26.490 MHZ
BAND B = 28.500 TO 28.990 MHZ
BAND F = 26.500 TO 26.490 MHZ
BAND C = 29.000 TO 29.490 MHZ
BAND G = 26.965 TO 27.405 MHZ
BAND D = 29.500 TO 29.990 MHZ
BAND H = 27.000 TO 27.490 MHZ
BAND I = 27.500 TO 27.990 MHZ

BAND "G" IS THE STANDARD CB BAND STARTS UP AT CH.9, 27.065 MHZ.

(Note: I haven't tried this, proceed at your own risk. And.....
***DO NOT transmit outside of the Ham band!***
    (you don't want to loose your license!)

    Use the above to listen only, or for use with a transverter.
    Or use with a dummy load, to generate test signals for checking
    receivers.    WA2ISE)

>What is the best way to measure harmonics of radio gear?

A cheap way to detect the presence of harmonics, (if they are really strong!), is to use a low pass filter with a simple power meter. If you see significant change in power with the insertion/removal of the low-pass filter, then you probably have significant harmonic content in your signal. I have used this technique a lot at 10 GHz, where spectrum analyzers are expensive and hard to come by.

What is it about this forum that has people flaming each other before they even engage their brains??? It gives the non-ham readers a great perspective of us.

A case in point... In a recent basenote someone ask for information about an amplifier he had bought, and was about to use it on 11 meters. That had napalm coming out of every orifice on the net. Did anyone think that he was not aware of what he was doing?

I wrote him a friendly note relating what the limits were for 11 meters and what could happen if he were to use it, and get caught. I also said that this might be just the thing to get him interested in Amateur Radio.

He wrote back and was wanting all the information he could get on us Hams. His interest in radio had aways been strong, but he never made the contact with the Amateur community. He was very greatfull for the comments and said he was going to pursue his ticket.

I reminded him that not all hams that use this forum are A**holes and have the napalm storage option on their discs.

Re: lid filters

Maybe we need a more direct approach. Give each US ham three demerit votes. When a lid is encountered, the ham sends a demerit vote to the FCC. If a lid receives more than three demerits per year from different hams, the lid loses their license for a while. Yes, it could be abused, but the abusers would lose their licenses, too.

Re: memorization

I memorized my way to a BSEE. The multiple-guess tests are no different than what goes on in colleges across the country. The only difference is that hams memorize Ohms Law, while engineering students derive it from Maxwell's equations.

It would be better if the VECs could mix up the a/b/c/d order, though. Fill-in-the-blank would be the next step.

As I understand it, we (US hams) have quite a bit of leeway from the

FCC. If we want to change the question pool, or the format of the test, I think the opinion of the ARRL and US hams would carry some weight.

I have the 949C tuner. Now that I've built an amplifier capable of 300W (the 949C's limit), I find that I burn out switch contacts if I use full rated power on it.

I guess I'll have to find rig up a pair of 6-position ceramic (aka REAL) RF switches. I am a little disappointed, but not entirely surprised.

kantronics makes some monoband hf equipment, but from the picture
it looked closer to mobile-sized rather than ht-sized. also, i
recall they delivered a bit more than qrp power, perhaps 25W. i
saw them in the ege (now haro) catalog.

also, aea makes a 10m, large-ht-sized qrp radios which include a
built-on antenna. i'm not sure what other bands (if any) are
available.

Ah... so unless there are some other unusual or unacceptable restrictions,
then this license class does suffer from lack of publicity. Of course
being "south of the border" I would not know much about it (as my above
ignorance shows) but had THAT existed when I was in high school here, I

would have been a ham 14 years earlier than I did.

It might be curious to see who can bring in the most hams in the US when the nocode license becomes a reality.

So a "Digital" ham in Canada can go buy a 2 meter HT and call up any other ham over the local 2 meter repeater?

X-Reader: NETNEWS/PC Version 2.1

I've build a spectrum analyser (0-100MHz) that has a 10.7MHz IF (from HAM-RADIO years ago) and it works quite well but I'm not happy with the log-amp/detector.

The detector at 10.7MHz is cascade of amplifier stages each with the same gain (10dB) and a diode halfwave detector from each stage. The outputs of the detector are summed. Unfortunately it needs a lot preset pots to get it working correctly and its linearity is not as high as I'd like.

Also I'd like to try making a direct conversion spectrum analyser - it would need to be DC coupled. The log detector would then run at a much lower frequency. I've tried using S-meter output of a CA3089 and its logarithmic but doesn't have the required dynamic range (> 60dB).

How does one make real log amps that don't need lots of preset adjustment?

Ideas ??

Giovanni

As the discussion of the merits/foibles of the no-code proposal rage on, I've seen numerous discussions of how existing Novices and Techs should be grandfathered into the *new* licensing structure. Well, I think the FCC will be inclined to grant little beyond exam credit for elements passed (i.e. you will get credit for those exam elements already passed, but no additional privleges). They will also be inclined to preserve the existing privleges even though the license classes in question may disappear.

So, if you are inclined to believe that Techs will be grandfathered to general, DON'T HOLD YOUR BREATH!!! If the past is any indication, it ain't going to happen. Look at what happened to Techs after *Novice Enhancement*: The *old* Techs got NO extra priv's outside of what was given to the Novice class, but they are given credit for passing elements 3A and 3B.

If ever the FCC had an excuse to grandfather the old Techs to general, this was it, in that the ONLY difference between an old Tech and a General was the code requirement. It's been a popular myth that someday the FCC would grandfather Techs to General. This myth has been around longer than I have been a ham (13 yrs), and still presists. But, the FCC never did, and I have serious doubts that they will!

As far as I'm concerned, there should be only two license classes:

1. All privleges (bands, modes, power, etc) 50 MHz and above.

2. All privleges, All bands.

The second license would only require obtaining a CW endorsement (to satsify ITU regs) to the ticket granted above (1). The theory tests would be IDENTICAL (!!!). This would get us back to a very simple licensing structure, much easier to administer than the current (and some proposed) scheme.

Of course, this will, in all probability, never come about. Incentive licensing has done more to stratify the amateur population in the US than anything I can think of. If a simplified licensing structure such as what I have illustrated above were ever to come up for consideration, the objections raised by those factions (and they know who they are) determined to protect their turf, so to speak, would doom it to defeat in short order. Incentive licensing was a BAD idea in 1964, and it's still a bad idea today.

Regardless of what happens to the existing classes, the success or failure of the no-code license depends on a couple of factors. First, they must be integrated into the VHF mainstream. This means access to 2 meters (at least, 6 would be super along with 2). Face it, the vast majority of operation at VHF is conducted on 2 meter FM (I don't want to start a flame war or to denegrate the users of any other VHF band or mode, but have you ever tried to work 2m SSB away from populated areas when the band's not open?)

Second, for the benefit of all concerned, we NEED to clean up our collective act in regard to operating practices. We all could be a little more courteous and considerate of others when operating. Most of the problems on 20 meter phone could be cured with a healthy does of courtesy and common sense. If/when no-code becomes a reality, we are going to have to set a good example for the new ops to avoid chaos (we're already setting a good example for the newcommers, right???).

Following is the complete text of the FCC Codeless Proposal, known as PR Docket No. 90-55. Although Iave attempted to proofread the document, I may not have caught all of my typos, especially since it was a fairly long document to type and I did it in one sitting. The typos that were in the iginal FCC document have been left intact.

I have dividedt into four parts due to its length.

If you don't want it, now's the time to hit the "N" key
but for those who do, here goes...

73,

Jim Dockery, WB2HBZ
ARRL Section Emergency Coordinator
Northern New Jersey Section

The opinions expressed above are mine. They do not represent the views of the American Radio Relay League, its directors or any other elected official of the league.

	RM-6994	RM-6995

NOTICE OF PROPOSED RULE MAKING

Adopted: February 8, 1990; Released: February 16, 1990

By the Commission:

I. INTRODUCTION

1. In this Notice of Proposed Rule Making (Notice), we propose to establish a new class of amateur operator license that would not require the applicant to prove that he or she can send and receive manual Morse code telegraphy messages. This proceeding was initiated by twelve petitions for rule making filed on matters generally relating to amateur operator license class structure, requirements and privileges.(1)

II. BACKGROUND

2. The amateur service exists for the purpose of self-training, intercommunication and technical investigations carried out by duly authorized persons interested in radio technique solely with a personal aim and without pecuniary interest.(2) Article 32 of the international Radio Regulations requires, among other things, that each person seeking a license to operate the apparatus of an amateur station prove that he or she has the ability to send correctly by hand to receive correctly by ear text in Morse code signals. Although this requirement may be waived for an operator of an amateur station transmitting only on frequencies above 30 MHz(3), each of the five classes of operator licenses issued by the Commission(4) requires the applicant to pass an examination in the international Morse code.(5)

3. Over the years, the Commission has received requests from persons who want to pursue the purposes of the amateur service, but who argue that Morse code telegraphy is an unnecessary barrier to obtaining a license. Historically, however, the amateur community has strongly supported a telegraphy skill requirement for every class of amateur operator license. In a 1974 rule making proceeding(6), and again in a 1983 rule making proceeding(7), amateur licensees showed nearly unanimous opposition to proposals for a no-code license.

4. In the 1974 rule making proceeding, we proposed an overall restructuring of the classes of amateur operator license. Included in those proposals was the establishment of a codeless class of license. Although it resulted in several improvements to the license structure, the proceeding was terminated without action on the codeless license class.(8) It was during the pendency of this proceeding that the computer-aided license application processing system currently in use was developed. The capability for processing a sixth class of license, therefore, was incorporated into the design for the system. In the 1983 rule making proceeding, the Commission again sought ways to provide a class of codeless license. One proposal was the deletion of the slow speed telegraphy examination requirement for the Technician Class license.(9) The alternative proposal was a new operator license class patterned after a Canadian codeless class of amateur license, and having very difficult written examination requirements. The proceeding was also strongly opposed by the amateur community and was terminated without action.(10) The above-listed petitions initiating this proceeding, however, indicate that the sentiment in the amateur community now appears to favor a codeless license class. The ARRL, for example, states that it now supports a codeless license as being "beneficial to the future, short and long term, of the Amateur Service."(11) The issue of a codeless class of amateur operator license, therefore, should be considered in light of current circumstances in the amateur service.

III. DISCUSSION

5. A significant segment of the amateur community has a new view of the role of telegraphy in the future of the service. David Stall states that "numerous recent surveys have demonstrated that the concept of a no-code license is rapidly attracting a wide base of support within the amateur community."(12) The ARRL states that its recent studies show:

> Encouraged by changes in the FCC rules, packet radio and other digital modes have become extremely popular and have led to amateur radio becoming increasingly attractive to computer-literate individuals who pssess the ability to contribute significantly to the service, but who fail to perceive the relevance of the manual Morse code. Many amateurs welcome the idea of providing a gateway to these individuals. The possibility now exists to dispassionately evaluate a codeless amateur license on its own merits. It is this factor that accounts for what the League perceives as a

> significant shift in attitudes among amateurs toward a codeless amateur license.(13)

6. The SCATG states that the time is right for a codeless class of license:

> Morse code operations were once the only way to make radio communications possible. It is now just a facet of an entire spectrum of possible methods of radio communications. It is no longer in keeping with the basis and purpose of the Amateur Radio service and to stress one facet of radio communications over all others. Knowledge of code doesn't eliminate rules violations or uncourteous operations.(14)

7. Burt Fisher, a teacher of electronics at a regional high school, states "the public need would best be served if there were a door into amateur radio that had a limited code requirement. Once in the door, these youngsters would be tempted to the rest of the world (and technology) of amateur radio. The public would be served as the base of potential scientists and technicians would be enhanced..." He believes that a written examination could be used to ascertain that an entry level license applicant has knowledge of telegraphy.(15) Michael Trahos believes that it is essential to have a codeless beginner license so that the amateur service will not stagnate or experience a decrease in the number of licensees. He believes that if a codeless license is not established, the number of licensed amateur operators will decrease, with a consequent increasing re-allocation of amateur service spectrum by the Commission to the land mobile services.(16)

8. John McCord believes a codeless classs of license would "attract many young minds to the hobby of amateur radio..."(17) Dennis and Linda Welch find the issue of a codeless class of license contentious and defended mostly by the older amateurs and championed by the very population needed for expansion.(18) Bill Welsh, who has a personal preference for code operation, foresees "that its years as a realistic amateur radio licensing requirement are coming to an end."(19) James E. Taylor states that telegraphy is no longer necessary and that the number of

amateur operators must be drastically increased in order to "continue to justify our existence."(20) Clement Bourgeois, however, disagrees. He states that a knowledge of telegraphy by every amateur operator is essential. He does believe, however, that the high speed telegraphy examination(21) should be reduced to 15 words-per-minute or less.(22) Larry Ballentine suggests that telegraphy examinations only require the examinee to recognize telegraphy characters, rather than to send and receive text at specific rates of speed.(23)

9. Operator License Structure. The petitions espouse various views on the structure of the license ladder. The general consensus, however, is that a codeless class of license should be the beginning step on the ladder. The ARRL believes that there is nothing antiquated or irrelevant about the Morse code, or its use in the Amateur Radio Service, but that this is a "matter that some individuals must learn for themselves, in order

to appreciate that relevance."(24) Most of the petitions favor a structure that avoids any negative effect upon any current licensee. One approach would add a sixth class of operator license modeled after the Novice Class, without the telegraphy requirement. He believes that a codeless license should provide "a no-code entry into amateur radio without disrupting the existing classes, privileges, or incentives."(25) Burt Fisher also favors the sixth class approach,(26) as does ARRL, with the codeless class positioned in the license structure so that there is an upward path "to the present Technician license by way of a five words per minute More code examination..."(27)

10. Another approach taken in the petitions is to preserve the current five class structure by conversion of the Novice Class to a codeless class. John McCord, for example, recommends elimination of the telegraphy requirement for the Novice license.(28) In addition to conversion of the Novice Class, Dennis and Linda Welch also suggest a merger of the Technician and General Classes.(29) The SCATG recommends that the Novice Class be gradually replaced by a non-renewable codeless class that would "minimally disrupt the existing license structure to avoid disenfranchising current licensees. ...[t]he new license should avoid isolating the newcomer from the mainstream of amateur radio operators and operations while maintaining the incentive to upgrade and providing attractive privileges for the newcomer...."(30)

11. Other petitions suggest major revisions to the license class structure. James Taylor states that prospective amateur

operators "are put off by the present complex, layered structure of our hobby..." He suggests one all-purpose operator class.(31) Alan Horowitz suggests "a no-code ham license, similar to Canada's license structure."(32) Michael Trahos, however, states that "[t]he Canadian no-code experience has clearly shown that creation of a no-code license class with examination requirements greater than that of the lowest available code license class fails to promote interest in, or insignificantly increases, the number of licensed amateur radio operators."(33) He suggests, instead, two new codeless classes.(34) Bill Welsh believes that emission mode privileges should be earned "by passing written and on-the-air operating tests that are directly related to the desired additional emission/mode privilege being sought."(35) He suggests that all frequency segments no offered as incentives be eliminated.(36)

12. Operator privileges. The petitions generally concur that, as a minimum, a station control operator holding a codeless class of license be authorized all emission privileges on the 1.25 meter (m) and shorter wavelength bands. For the longer wavelength bands, however, there are several views, starting with James Taylor's recommendation that all possible privileges be authorized to the codeless class.(37) Michael Trahos and SCATG recommend including the 6 m and 2 m bands.(38) Burt Fisher recommends authorizing the 52-54 MHz segment in the 6 m band. He also recommends include the 2 m band, but excluding emission F3E

on that band.(39) The ARRL recommends excluding operation on both the 6 m and 2 m bands.(40) Dennis and Linda Welch,(41) David Stall,(42) and John McCord make recommendations similar to those of the ARRL. John McCord, however, suggests including digital type emission privileges on the 6 m and 2 m bands.(43)

13. The petitions recommend that the eligibility for the codeless class of license, like all amateur operator licenses, require the passing of a written examination. The ARRL states that the written examination should reflect the privileges to be earned and require a greater commitment than does the present Technician class written examination. It believes that the lessons learned from codeless license programs in other countries necessitate a significant written examination. The ARRL recommends, therefore, that a written examination for the codeless license be administered under the Volunteer Examiner Coordinator (VEC) system. The ARRL also recommends a 60 question written examination consisting of the current 55 question written examination for the Technician Class Operator license, augmented by five additional questions related to the specific privileges

afforded the codeless licensees. Two of the new questions would be concerned with the application and use of telegraphy and the remainder would be concerned with digital communication techniques.(44) The SCATG states that the written examination should consist of 50 questions.(45)

14. The petitions also suggest names for a new codeless class of license. The SCATG suggests "Apprentice."(46) Burt Fisher suggests "Novice-V."(47) Michael Trahos suggests "Novice-Plus" and "Technician-Plus."(48) David Stall suggests "Limited."(49) The ARRL states that its suggested name "Communicator," although "not exactly reflective of the type of license envisioned in the proposal... is, however, the most descriptive among those alternatives considered."(50)

IV. PROPOSAL

15. We believe that the petitions have merit. Further, like the petitioners, we believe that this is a propitious time to propose the establishment of a codeless license, given the advances in electronic communications in the past few years. We propose, therefore, to establish a codeless class of amateur operator license, the Communicator Class. With respect to this proposed operator class, we have established three objectives. Our first objective is to offer an entry level license opportunity to all persons who find the telegraphy requirement a barrier to pursuing the purposes of the amateur service. Our view is best expressed by the statement of the ARRL that "the goal of the codeless amateur license is to bring such licensees in to the 'mainstreem' of the Amateur Radio Service, and to encourage them to upgrade their license class."(51) Our second objective is to propose a type of license that can be implemented quickly if a decision is made to proceed. Our third objective is to avoid any negative effect upon current licensees, upon the work of the volunteer examiners, or upon the Commission's

cut here
----

workload and resources. To preclude any impact on our resources, it is imperative that our existing computer-aided application processing system be utilized "as is."(52) The proposed rule amendments are contained in the attached Appendix.

16. In proposed Sections 97.501 and 97.503(b)(1), we would require that the applicant for a Communicator Class license pass a 60 question written examination, as requested by ARRL. In sum, there would be an expanded entry level examination and corresponding question pool. We concur with ARRL that the written examination for the Communicator Class License should correspond to the privileges for that class of license.(53) The new question pool would be comprised of questions from the two pools currently used in the Novice and Technician license examinations, and new questions as requested by ARRL.(54) By incorporating existing questions, over 91 percent of the question pool for a Communicator Class license would already be available and would help facilitate a smooth transition.(55)

17. Operator license structure. In proposed Section 97.9, we would incorporate the Communicator Class in a simplified license structure containing four ascending steps: Communicator, General, Advanced, and Amateur Extra Classes. Current Technician and Novice Class operator licenses would be grandfathered indefinitely. There would be no new licenses issued for those license classes, but existing licenses could be modified or renewed. This approach would meet the objectives we established in paragraph 15. Dennis and Linda Welch, John McCord and SCATG suggested preserving the five-step ladder by eliminating the telegraphy examination requrement from the Novice class license. This approach deserves careful consideration by the amateur community because of its simplicity. We did not propose this approach because of its disadvantage of lowering the license qualification standards for the Novice operator class. As such, it may be unacceptable to the hundreds of thousands of amateur operators, included the 85,000 current Novice Class licensees, who qualified for the Novice licence by passing a telegraphy examination. The Novice Class has operating privileges below 30 MHz, necessitating the need for a knowledge of telegraphy as described in paragraph 2.

18. For future licensees, the Communicator Class license would be the first step in the license structure instead of the

Novice Class. Our premise is that most newcomers to the service, given the choice, would elect to qualify for the Communicator Class license rather than the Novice Class license. There would, therefore, no longer be a need for the Novice Class license, We particularly invite instructors, volunteer examiners (VEs), and VECs to submit comments on the validity of this premise, including factual information on the time and effort that would be required for persons to prepare tor the proposed 60 question Communicator Class written examination as compared to the time and effort currently required for the Novice Class 30 question written examination and telegraphy examination.

19. Because the written examination for the Communicator Class license would be more comprehensive than that of the Technician Class license, the Communicator Class would also serve in the stead of the Technician Class for future licensees. Each step in the proposed four step structure provides recognition that the holder has significantly advanced his or her skill in both the communication and technical phases of the radio art.(56) This structure could be rapidly implemented. The present license application processing system and license application form would continue to be used.(57)

20. Operator Privileges. The proposed control operator privileges of the Communicator Class would generally be those suggested by the ARRL. The privileges would include all authorized emission types. The proposed transmitter power standard would be 200 watts peak envelope power. The licensee's station would be eligible for a Group D call sign.(58) Stations with Communicator Class control operators would not be permitted to transmit on the 2 m and 6 m bands. In view of ARRL's desire to bring the codeless class into the mainstream of the amateur service,(59) however, we particularly invite comment on the effect of excluding Communicator Class licensees from these two popular bands.

21. The ARRL stated that one premise for its petition was that an accommodation should be made for codeless class licensees to upgrade their license class. It cited countries that have codeless licenses where the written examination tests the examinee's technical qualifications. The ARRL stated that amateur service societies in countries such as Australia, the Federal Republic of Germany, and Belgium report ongoing telegraphy activities among the codeless class licensees working to upgrade the license class.(60) While the proposed Communicator Class privileges include telegraphy on the 1.25

meter and shorter wavelength bands, we recognize that telegraphy operation is more closely assiciated with the HF bands. The opportunity for newcomers to the amateur service actually to send and receive messages in the Morse code on small segments of the HF 80, 40, 15, and 10 meter bands is provided to the Novice and Technician Classes so that those operators can gain an appreciation of telegraphy tand acquire the proficiency needed to pass the telegraphy examination for the General Class operator license. We specifically request comments, therefore, concerning the desirability of including the opportunity for Communicator Class licensees also to experience on-the-air telegraphy operation on the HF bands. In view of our obligation under the provisions of the international Radio Regulations,(61) if it is desired, only domestic communications on the HF bands would be authorized.

22. Under proposed Section 97.301(g), a Communicator Class licensee who passes, or otherwise receives credit for a telegraphy examination, would be authorized the additional privileges of the Technician Class.(62) To avoid a license processing burden, however, the documentation of the passing of,

or credit for, a telegraphy examination would be evidenced by the Certificate of Successful Completion of Examination (CSCE) issued by the administering VEs,(63) rather than by the issuance of a Technician Operator license. Theindicator used by the Communicator Class for identification purposes would be AC.(64) Under propsed Section 97.505(a)(1), VEs would be authorized to grant examination credit, evidenced by a CSCE, to a Communicator Class examinee for the slow speed telegraphy examination when the examinee holds a Novice Operator license.(65) That combination, Communicator Class license and CSCE, would permit the Communicator Class licensee the same rights and privileges of the Technician Class operator. The VECs would provide listings, in paper or magnetic for, of the Communicator Class licensees who have been issued the CSCE.

23. Volunteer examiners. The instant proposal contains substantive changes in the amateur operator license examination procedure and the issuance of amateur operator licenses and CSCEs. All operator license examinations would be administered under the VEC system.(66) The additional task of administering the Communicator Class would be offset by the elimination of other tasks, included the discontinuance of the two-examiner system for the Novice Class license.(67) The coorination and oversight by the VECs provide more credible results than does the two examiner system. In the latter, examination administration

errors are more common and cheating is a greater problem than in the VEC system. The task of administering new Technician Operator Class licenses would also be discontinued.(68) The Novice and Technician written examinations would no longer be prepared and adminsisted as separate examinations. The VEs and VECs, moreover, coulb e reimbursed for out-of-pocket costs incurred in connection with all examinations.(69)

V. CONCLUSION

24. We believe that this proposal would achieve the objectives set forth in paragraph 15 above. We seek comments, therefore, on the proposed revisions to Part 97 to establish a Communicator Class Operator license for the amateur service, as set forth in the attached Appendix.

VI. PROCEDURAL MATTERS

25. For purposes of this non-restricted notice and comment rule making proceeding, members of the public are advised that ex parte presentations are permitted except during the Sunshine Agenda period. Se generally 47 C.F.R. & 1.1206(a). The Sunshine Agenda period is the period of time which commences with the release of a public notice that a matter has been placed on the Sunshine Agenda and terminates when the Commission (1) releases the text of a decision or order in the matter; (2) issues a public notice stating that the matter has been deleted from the Sunshine Agenda; or (3) issues a public notice stating that the matter has been returned to the staff for further consideration, whichever occurs first. 47 C.F.R. & 1.202(f). During the Sunshine agenda period, no presentation, ex parte or otherwise,

are permitted unless specifically requested by commission or staff for the clarification or adduction of evidence or the resolution of issues in the proceeding. 47 C.F.R. & 1.1203.

26. In general, an ex parte presentation is any presentation directed to the merits or outcome of the proceeding made to decision-making personnel which (1) if writte, is not served on the parties to the proceeding, or (2), if oral, is made without advance notice to the parties to the proceeding and without opportunity for them to be present. 47 C.F.R. & 1.1202(b). Any person who makes or submits a written ex parte presentation shall provide on the same day it submitted two copies of same under separate cover to the Commission's Secretary for inclusion in the public record. The presentation (as well as any transmittal letter) must clearly indicate on its face the docket number of the particular proceeding to which it relates and the fact that two copies of it have been submitted to the Secretary, and must be labeled or captioned as an ex parte presentation. 47 C.F.R. & 1.1206

27. Any person who is making an oral ex parte presentation and presents data or arguments no already reflected in that person's written comments, memoranda, or other previous filings in that proceeding shall provide on the day of the oral presentation an original and one copy of a written memorandum to the Secretary (with a copy to the Commissioner or staff member involved) which summarizes the data and arguments. The memorandum (as well as any transmittal letter) must clearly indicate on its face the docket number of the particular proceeding and the fact that an original and one copy of it have been submitted to the Secretary, and must be labeled or captioned as an ex parte presentation. 47 C.F.R. & 1.1206.

28. Authority for issuance of this Notice is contained in Sections 4(i) and 303(l) and (r) of the Communications Act of 1934, as amended. 47 U.S.C. && 154(i) and 303(l) and (r). Pursuant to applicable procedures set forth in Sections 1.415 and 1.419 of the Commission's Rules, 47 C.F.R. && 1.415 and 1.419, intested parties may file comments on or before August 6, 1990,

In article <596@massey.ac.nz> GMoretti@massey.ac.nz (Giovanni Moretti) writes:

> I've build a spectrum analyser (0-100MHz) that has a 10.7MHz IF (from HAM-RADIO years ago) and it works quite well but I'm not happy with the log-amp/detector.

Most log amps use the relationship that the base-emitter voltage of a transistor is proportional to the logarithm of the emitter current (sometimes approximated as the collector current). A good low-noise transistor will follow this "ideal diode" curve for about eight orders of magnitude in the collector current (power ratio 160 dB). Routine use of this effect is complicated by the temperature dependence of the equation,

Ie= Is * exp(q* Vbe/(k * T))

and a good logarithm amplifier either needs a second (matched) transistor at the same temperature to set the operating point, or a thermostat. The National Semiconductor Linear Applications databook has one thermostat-style solution, in AN-264. The thermostat they use employs three transistors, with one transistor doing the logarithm conversion, a second measuring the temperature, and a third acting as the heater. The thermostat approach does NOT require matched transistors.

The second approach, with matched transistors is slightly less accurate (mainly because of mismatched emitter resistances at elevated currents), but works at lower total power dissipation. I think the National databook has one of these, also; AN-29, Figure 23.

I would suggest using the cookbook circuits, since at the lowest current ranges these are not terribly easy to frequency-compensate (i.e. the op amps will likely oscillate), and these circuits have already been debugged.

The second part of your problem is the precise rectification of the IF-frequency signal; all I can think of is a good hot-carrier diode, and keeping 60 dB of accuracy there is not going to be easy. Good luck.

Your local National Semiconductor distributor (or the representatives in Australia: telephone (03) 729-6333) can supply the application notes I quoted above.

I am known for my brilliance,   John Whitmore
 by those who do not know me well.

and reply comments on or before September 7, 1990. All relevant and timely comments will be considered by the the Commission before final action is taken in this proceeding. To file formally in this proceeding, participants must file an original and four copies of all comments and reply comments. If participants want each Commissioner to receive copies of their comments, an original and nine copies must be filed. Comments and reply comments must state the proceeding to which they relate (PR Docket Number). They should be sent to the Secretary, Federal Communications Commission, Washington, D.C. 20554. Comments and reply comments will be available for public inspection during regular business hours in the Dockets Reference Room (Room 239) of the Federal Communications Commission, 1919 M Street N.W., Washington, D.C. 20554.

29. In accordance with Section 605 of the Regulatory Flexibility Act of 1980, 5 U.S.C. & 605, the Commission certifies that these rules would not, if proulgated, have a significant economic impact on a substantial number of small entities, because these entities may not use an amateur station to transmit any communication the purpose of which is facilitate the business or commercial affairs of any party. See 47 C.F.R. & 97.113(a). Moreover, the proposed rules would not require the use of or significantly enhance the sale of any additional amateur station apparatus.

30. The proposal contained herein has been analyzed with respect to the Paperwork Reduction Act of 1980, 44 U.S.C. & 3501 et seq., and found to increase the information collection burden which the Commission imposes on the public. This proposed increase in the information collection burden is subject to

approval by the Office of Management nd Budget as prescribed by the Act.

31. A copy of the Notice will be forwarded to the Chief Counsel for Advocacy of the Small Business Administration.

FEDERAL COMMUNICATIONS COMMISSION

Donna R. Searcy
Secretary

APPENDIX

Part 97 of Chapter I of Title 47 of the Code of Federal Regulation is proposed to be amended as follows:

1. The authority citation for Part 97 continues to read as follows:

Authority citation: 48 Stat. 1066, 1082, as amended; 47 U.S.C. & 303. Interpret or apply 48 Stat. 1064-1068, 1081-1105, as amended; 47 U.S.C. && 301-609, unless otherwise noted.

2. Section 97.9 is revised to read as follows:

& 97.9 Operator License

(a) The classes of operator licenses are Communicator, General, Advanced, and Amateur Extra. There are also two grandfathered classes of operator licenses, Novice and Technician. An operator license authorizes the holder to be the control operator of a station with the privileges of operator class specified on the license. The license document or a photocopy thereof must be in the personal possession of the licensee at all times when the person is the control operator of a station.

(b) A person holding a Communicator Class operator license and who holds a CSCE indicating that the person passed element 1(A), 1(B), or 1(C) is authorized to exercise the rights and privileges of the Technician Class for the duration of the license and renewal thereof.

(c) A person holding a Novice, Technician, Communicator, General, or Advanced Class operator license who has properly filed with the FCC an application for a higher operator class that has not yet been acted upon, and who holds a CSCE indicating that the person passed the necessary examinations within the previous 365 days is authorized to exercise the rights and privileges of the higher operator class.

3. Section 97.17(a) is revised to read as follows:

& 97.17 Application for new license.

(a) Any qualified person is eligible to apply for an amateur service license. No new Novice or Technician Class operator licenses will be issued.

* * * * *

4. Section & 97.119(e) is revised to read as follows:

& 97.119 Station Identification.

* * * * *

(e) When the control operator is using privileges on the basis of holding a CSCE, an indicator must be included after the call sign as follows:

(1) AC for Communicator Class Operator;
(2) AG for General Class Operator;

(3) AA for Advanced Class Operator;
(4) AE for Amateur Extra Class operator.

* * * * *

5. Section 97.301(a) is revised and a new paragraph (g) is added to read as follows:

& 97.301 Authorized Frequency Bands.

* * * * *

(a) For a station having a control operator holding a Technician, Communicator, General, Advanced or Amateur Extra Class operator license:

Wave-length band	ITU Region 1	ITU Region 2	ITU Region 3	Sharing requirements See & 97.303 Paragraph:
VHF	MHz	MHz	MHz	
1.25 m	---	222-225	---	(a).(b).(e)
UHF	MHz	MHz	MHz	
70 cm	430-440	420-450	420-450	(a).(b).(f)
33 cm	---	902-928	---	(a).(b).(g)
23 cm	1240-1300	1240-1300	1240-1300	(j)
13 cm	2300-2310	2300-2310	2300-2310	(a).(b).(j)
-do-	2390-2450	2390-2450	2390-2450	(a).(b).(j)
SHF	GHz	GHz	GHz	
9 cm	---	3.3-3.5	3.3-3.5	(a).(b).(k).(l)
5 cm	5.650-5.850	5.650-5.925	5.650-5.850	(a).(b).(m)
3 cm	10.00-10.50	10.00-10.50	10.00-10.50	(b).(c).(i).(n)
1.2 cm	24.00-24.25	24.00-24.25	24.00-24.25	(a).(b).(i).(o)
EHF	GHz	GHz	GHz	
6 mm	47.0-47.2	47.0-47.2	47.0-47.2	
4 mm	75.5-81.0	75.5-81.0	75.5-81.0	(b).(c).(h)
2.5 mm	119.98-120.02	119.98-120.02	119.98-120.02	(k).(p)
2 mm	142-149	142-149	142-149	(b).(c).(h).(k)
1 mm	241-250	241-250	241-250	(b).(c).(h).(q)
---	above 300	above 300	above 300	(k)

* * * * *

(g) For a station having a control operator holding a Technician, General, Advanced or Amateur Extra Class operator license:

Wave-length band	ITU Region 1	ITU Region 2	ITU Region 3	Sharing requirements See & 97.303 Paragraph:
VHF	MHz	MHz	MHz	
6 m	---	50-54	50-54	(a)
2 m	144-146	144-148	144-148	(a)

6. Section 97.501 revised to read as follows:

& 97.501 Qualifying for an amateur operator license.

An applicant must successfully pass an examination for the issuance of a new amateur operator license and for each change in the operator class. Each applicant for the class of operator license specified below must pass, or otherwise receive examination credit for, the following examination elements.

(a) Amateur Extra Class operator: Element 1(C), and elements 3(A), 3(B), 4(A), and 4(B);

(b) Advanced Class operator: Element 1(B) or 1(C), and elements 3(A), 3(B), and 4(A);

(c) General Class operator: Element 1(B) or 1(C), and elements 3(A), and 3(B);

(d) Communicator Class operator: Element 3(A).

7. Paragraphs (b) and (c) of Section 97.503 are revised to read as follows:

& 97.503 Element Standards.

* * * * *

(b) A written examination must be such as to prove that the examinee possesses the operational and technical qualifications required to perform properly the duties of an amateur service licensee. Each written examination must be comprised of a question set as follows:

(1) Element 3(A): 60 questions concerning the privileges of a Communicator Class operator license. The minimum passing score is 45 questions answered correctly.

(2) Element 3(B): 25 questions concerning the additional privileges of a General Class operator license. The minimum passing score is 19 questions answered correctly.

(3) Element 4(A): 50 questions concerning the additional privileges of an Advanced Class operator license. The minimum passing score is 37 questions answered correctly.

(4) Element 4(B): 40 questions concerning the additional privileges of an Amateur Extra Class operator license. The minimum passing score is 30 questions answered correctly.

(c) The topicls and number of questions required in each question set are listed below for the appropriate examination element:

Topics	Element: 3 (A)	3 (B)	4 (A)	4 (B)
(1) FCC rules for the amateur radio services	15	4	6	8
(2) Amateur Station operating procedures	7	3	1	4
(3) Radio wave propagation characteristics of amateur service frequency bands	4	3	2	2
(4) Amateur radio practices	11	5	4	4
(5) Electrical principles as applied to amateur station equipment	6	2	10	6
(6) Amateur Station equipment circuit components	4	1	6	4
(7) Practical circuits employed in amateur station equipment	3	1	10	4
(8) Signals and emissions transmitted by amateur stations	4	2	6	4
(9) Amateur station antennas and feed lines	6	4	5	4

8. Section 97.505(a) is revised to read as follows:

& 97.505 Element credit.

(a) The administering VEs must give credit as specified below to an examinee holding any of the following documents:

(1) An unexpired (or within the renewal grace period) FCC-issued Novice Class operator license: Element 1(A) and the 30 written questions in Element 3(A) based upon the material from the written examination passed for the Novice Class operator license.

(2) An unexpired (or within the renewal grace period) FCC-issued Communicator Class operator license: Element 3(A).

(3) An unexpired (or within the renewal grace period) FCC-issued Technician Class operator license: Element 3(A).

(4) An unexpired (or within the renewal grace period) FCC-issued Technician Class operator license issued before March 21, 1987: Elements 3(A) and 3(B).

(5) An unexpired (or within the renewal grace period) FCC-issued General Class operator license: Elements 1(B), 3(A), and 3(B).

(6) An unexpired (or within the renewal grace period) FCC-issued Advanced Class operator license: Elements 3(A), 3(B), and 4(A).

(7) A CSCE: Each element the CSCE indicates the exmanee passed within the previous 365 days.

(8) An unexpired (or within the renewal grace period) FCC-issued commercial radiotelegraph operator license or permit: Element 1(C).

* * * * *

9. Section 97.507 is revised to read as follows:

& 97.507 Preparing an Examination.

(a) Each telegraphy message and each written question set administered to an examinee must be prepared by a VE holding an FCC-issued Amateur Extra Class operator license. A telegraphy message or written question set, however, may also be prepared for the following elements by a VE holding an

FCC-issued operator license of the Class indicated:

(1) Element 3(B): Advanced Class operator.

(2) Elements 1(A) and 3(A): Advanced or General Class operator.

(b) Each question set administered to an examinee must utilize questions taken from the applicable question pool.

(c) Each telegraphy message and each written question set administered to an examinee for a Communicator, General, Advanced or Amateur Extra Class operator license must be prepared, or obtained from a supplier, by administering VEs according to instructions from the coordinating VEC.

(d) A telegraphy examination must consist of a message sent in the international Morse code at no less than the prescribed speed for a minimum of 5 minutes. The message must contain each required telegraphy character at least once. No message known to the examinee my be administered in a telegraphy examination. Each 5 letters of the alphabet must be counted as 1 word. Each numeral, punchuation mark and prosign must be counted as 2 letters of the alphabet.

A fellow from New Zeland wanted to know how to go about assembling a log amp. Probabley the easiest way is to get an Intersil ICL8048. I needs two resistors, a small 180pf cap and +/- 15 V and you're in business. It has 120 dB dynamic range for current input and 60 dB for voltage input.

The voltage is just turned into current. The voltage precision is then limited by the offsets of its internal op-amps. You can build wider range circuits discretely with either chopper stabilized and /or low Ib op amps but the jump in cost and time from this chip in performance is about 5x money and 30x time.

For you information: log amps and anti-log amps exploit the relationship that for a bipolar transistor Veb varies as the log of Ic. The chip packages it all very nicely for you. Analog Devices also has several entries in this field, but they are hybrids vs Intersil monolithics which translates to higher cost.

I've used the chip, it's cute.

John Wieczorek

FCC Docket Number 90-55   Page 17

10. In Section 97.511, the heading and the text are revised to read as follows:

& 97.511 Operator license examination.

(a) Each session where an examination is administered must be coordinated by a VEC. Each administering VE must be accredited by the coordinating VEC.

(b) Each examination for a Communicator Class operator license must be administered by 3 administering VEs, each of whom must hold an FCC-issued Amateur Extra or Advanced Class operator license.

(c) Each examination for a General, Advanced or Amateur Extra Class operator license must be administered by 3 administering VEs, each of whom must hold an FCC-issued Amateur Extra Class operator license.

(d) The administering VEs must make a public announcement before administering an examination. The number of candidates at any exmination may be limited.

(e) The administering VEs must issue a CSCE to an examinee who scores a passing grade on an examination element.

(f) Within 10 days of the administration of a successful examination, the administering VEs must submit the application to the coordinating VEC.

11. Section 97.513 is removed.

12. In Section 97.519, new paragraph (d) is added to read as follows:

& 97.519 Coordinating examination sessions.

* * * * *

(d) Each coordinating VEC must compile lists of Communicator Class operator licenses who have been issued a CSCE for Element 1(A), 1(B), or 1(C) during each calendar month. The VEC must forward a copy of the list to the Private Radio Bureau, FCC, Washington, DC 20554, by the 10th day following the end of the month.

13. Section 97.527 is amended by revising paragraph (a), removing paragraph (c) and redesignating paragraphs (d) (e) (f) and (g) as (c) (d) (e) and (f) to read as follows:

& 97.527 Reimbursement for expenses.

(a) VEs and VECs my be reimbursed by examinees for out-of-pocket expenses incurred in preparing, processing, administering, or coordinating an examination.

FOOTNOTES

(1) The petitions were received from the American Radio Relay League, Inc. (ARRL) (RM-6995), Larry Ballentine (RM-6991), Clement Bourgeois, Jr. (RM-6988), Burt Fisher (RM-6989), Alan Horowitz (RM-6984), John M. McCord (RM-6993), the Space Coast Amateur Technical Group (SCATG) (RM-6986), David K. Stall (RM-6994), James E. Taylor (RM-6985), Michael C. Trahos (RM-6990), Dennis and Linda Welch (RM-2987), and Bill Welsh (RM-6992). Subsequent to the Public Notice listing of the foregoing petitions, two additional petitions addressing the same matter were received from Larry Garens and Philip Howard. These petitions are included in the record of this notice and comment proceeding and will be given full consideration prior to a final determination in this matter.

(2) See No. 53 of the International Telecommunication Union Radio Regulations (geneva, 1979) (hereafter Radio Regulations). See also 47 U.S.C. & 153(q).

(3) See No. 2735 of the Radio Regulations.

(4) The license classes are, in ascending steps, Novice, Technician, General, Advanced and Amateur Extra.

(5) The examinations cover three levels of telegraphy skill. They are 5, 13, and 20 words-per-minute. The examinee must also pass certain written examination elements, depending upon the operator license class sought. See Sections 97.501 and 97.503 of the Commission's Rules, 47 C.F.R. && 97.501 and 97.503.

(6) Notice of Proposed Rule Making, Docket No. 20282, 39 Fed. Reg. 44042 (1974).

(7) Notice of Proposed Rule Makeing, PR Docket No. 83-28, 48 Fed. Reg. 4855 (1983).

(8) Third Report and Order, Docket No. 20282, 44 Fed. Reg. 16461 (1979).

(9) The qualification requirements for a Technician Class Operator license are passing the five words-per-minute telegraphy

examination, the 30 question written examination for a Novice Class Operator license, and the 25 question written examination for a Technician Class Operator license.

(10) Report and Order, PR Docket No. 83-28, 49 Fed. Reg. 1097 (1984).

(11) RM-6995 at 21.
(12) RM-6994 at 3.

(13) RM-6995 at 12 and 13, N. 11.
(14) RM-6996 at 3.
(15) RM-6989 at 1 and 2.
(16) RM-6990 at 5.
(17) RM-6993 at 2.
(18) RM-6987 at 1.
(19) RM-6992 at 1.
(20) RM-6985 at 1.

(21) The highest speed telegraphy requirement is 20 words-per-minute for the Amateur Extra Class operator license.

(22) RM-6988 at 2 and 3.
(23) RM-6991 at 1.
(24) RM-6995 at 15.
(25) RM-6994 at 1.
(26) RM-6985 at 1.
(27) RM-6995 at 18.
(28) RM-6993 at 1.
(29) RM-6987 at 2.
(30) RM-6986 at 1.
(31) RM-6985 at 1 and 2.
(32) RM-6984 at 1.
(33) RM-6990 at 4.
(34) RM-6990 at 20.
(35) RM-6992 at 2 and 3.
(36) RM-6992 at 3.

(50) RM-6995 at 17.
(51) RM-6995 at 19.
(52) The sixth license class designation is "Communicator."
(53) A written examination must be designed to demonstrate that the examinee has the operational and technical qualifications required to perform properly the duties of an amateur service licensee in accordance with the privileges authorized by the class of operator license sought. See 47 U.S.C. & 303(1)(1) and 47 C.F.R. & 97.503(b).

(54) Section 97.523, 47 C.F.R. & 97.523, requireds all VECs to cooperate in maintaining one question pool for each written examination element. Each pool must contain at least 10 times the number of questions required for a single examination.

(55) The current Technician Class question pool consists of 250 questions. There are currently 300 questions in the Novice Class question pool. An additional 50 question would be added, giving the proposed Communicator Class question pool a total of 600 questions.

(56) See Section 97.1(c), 47 C.F.R. & 97.1(c).

(57) Until a revised FCC Form 610 becomes available, the administering VEs would write in certain information on the current form in the case of an application for a Communicator Operator license. We would furnish information to the VECs for temporary use of the current form, if we decide to proceed with the Communicator Class license.

(58) The computer-aided application processing system selects a new call sign from four basic groupings for assignment to an amateur station. Each call sign is sequentially selected from an alphabetized region-group list that corresponds to the licensee's class of operator license and mailing address.

(59) RM-6995 at 19.
(60) RM-6995 at 14.

(61) See Radio Regulations, Nos. 2735 and 2736.

(62) The additional privileges include RTTY and data emissions

and phone emissions J3E and R3E in a segment of the 10 meter band, and all authorized emissions in the 2 and 6 meter bands. See && 97.301 and 97.303.

(63) A Certificate of Successful Completion of Examination is now issued by VEs. See Section 97.511(e), 47 C.F.R. & 97.511(e).

(64) Section 97.119(e) requires that an indicator must be included after the call sign whenever the control operator is using privileges based on hold a CSCE. The indicator AC is proposed for the Communicator Class.

(65) Currently, Section 97.505(a)(2), 47 C.F.R. & 97.505(a)(2), requires VEs to give credit to an examinee holding a certificate of successful examination (CSCE) indicating the examination was passed within the previous 365 days. Currently, Section 97.9(b), 47 C.F.R. 97.9(b), authorizes a licensee holding a CSCE indicating that he or she has completed the necessary examinations within the privious 365 days to exercise the rights and privileges of the higher operator class. The time limitation that would apply to the use of a CSCE in conjunction with the Communicator Class license authorizing the rights and privileges of the Technician Class would be the duration of the license term and renewal thereof.

(66) Eighteen organizations function as VECs. They accredit VEs, coordinate examination sessions, maintain the question pools, provide instructions to VEs, review and forward completed license application forms to the Commission for processing. Some 50,000 examinations are administered annually under the VEC system.

(67) Some 18,000 to 20,000 persons qualify for a Novice Operator Class license annually. The examinations are administered by two General, Advanced, or Amateur Extra Operator Class licensees selected by the examinee.

(68) Some 10,000 to 15,000 persons qualify for the Technician Operator Class license annually.

(69) Currently, VEs and VEC may only be reimbursed by examinees for expenses incurred in preparing, processing, administering or coordinating an examination for a Technician, General, Advanced,

or Amateur Extra Class Operator license. See 47 U.S.C. &
154(f)(4)(J) and 47 C.F.R. & 97.527.

Bob Parnass responded:

> Wrong.

Ok, now I'm confused (easily so I guess). I just received one of these (BC200XLT) via Grove. It makes my PRO34 look and feel very wimpy - how much are PRO34's worth on the used market? Grove included instructions that ADD a 2-10k resistor from pin 8 of one of the K1013 ICs down to a resistor adjacent to IC UC-1147. The mod seems to work, though I don't have enough working experience with the radio to know if I've lost some other operation.

Are there two way to make this mod? If so, what's the "better" way? Hacking out a resistor may cause slightly less power drain (but harder to undo)? I've just started a _Monitoring Times_ subscription, can anyone recommend a back issue article to read related to this?

I've done the following to sense if I have a significant problem with harmonics in 2 meter rigs: I found that cable-ready TV sets' channel 35 tunes around 292 Mhz, which is the 2nd harmonic of 146 Mhz. Connect the TV to an outside antenna, or rabbit ears (disconnect the catv). Key up the rig under test. See if you see any signal on the TV (you should see something, a clean rig will still produce a few uVolts which the TV will pick-up.) Compare the first rig with another one (like a commercial made HT). If you get similar signal strengths, you're *probably* OK. If you produce a big whopping signal with the rig under test, you know what that means!
Anyone know who lives around 292Mhz?

WRONG, WRONG, WRONG!!!!
Those who have only the digital license will NOT be grandfathered into
the Advanced license. They will only get VHF and above.
Those who currently hold the Amateur license (theory, regs and 10wpm) will
be grandfathered into the Advanced license.

Try Plessey. I can't find my data book but I'm sure they make some with at least 80dB dynamic range.

Another inexpensive source for a useful logger is the Motorola MC3356 and MC13055 FSK receiver ICs. These are really complete receivers including i-f amplification, log output, squelch and data recovery circuits but are in the $2 rice range. The log output seems to be pretty straight over a 60-70 dB range and the chip works pretty well at inputs up to 50 MHz or so. The MC3356 also has an oscillator (may be crystal controlled or tuned) and mixer built into it too so that the device makes pretty good material for a very-poor-man's spectrum analyzer.

But wait! Surely you have a dummy load! You're not going to test this equipment on the air are you? (Unless you're looking for external intermod, or such). A dummy load is the most expensive part of a "power attenuator". You don't need a precise amount of attenuation, since you're not measuring absolute power, but rather the relative power of the harmonics to the fundamental.

Here's a circuit you might try adding to your dummy load:

```
                              R2
Atten in from xmtr  >-------/\/\/\------<  Atten out, to spectrum analyzer.
                         |           |
                         |           |
                         \           \
                         /R1         / R3
                         \           \
                         /           /
                         |           |
                        GND         GND

                R1:  existing 50 ohm dummy load.
                R2:  2400 ohm, 2W carbon comp (or other non-inductive resistor
                                                  i.e. not wirewound)
                R3:  50 ohm 1/4 watt resistor
```

This circuit should give about 40dB of attenuation and handle 100 W. Keep all leads very short. Keep input and output as separate as possible.

If possible, put a sheet metal shield between R1 and R3, with a hole for R2.
I have something like this inside the little minibox on top of my
Heath Cantenna, which replaces the diode detector circuit Heath supplies.

Happy testing!

AEA makes a 10 meter and 6 meter HT that is xtal controlled. I think the
frequency can be pushed about 50 KHz with a tuning knob on the top and there
is provision for 2 crystals. I vaguely rember the price at $300. AEA called it
the DX-HANDY. Either 73 or QST reviewed it last summer. Reviewer had a QSO from
Calif. while standing in his back yard (in New York State) with the whip antenna
supplied with the rig.

I hope this helps,

Stan

This is done as a public service announcement:

A few days ago we had a line of thunderstorms roll through New Hampshire. As I usually do during this type of weather I unplugged the PRO-2004 from the wall and the antenna. Well I went to use it yesterday after about 4 days un-plugged and guess what ?? That's right. All of the memories had been wiped clean ! Now I have to go through and re-program 270 or so channels and 10 scan bank channels :-(I stoped and thought for a minute and I could not remember ever replacing the memory back up battery.

So the moral of the story is this: CHECK YOUR MEMORY BACK-UP BATTERIES

Dissident group to broadcast from ship
--------------------------------------------------------------------
A radio station calling itself the "Voice of Democracy in China" will begin
broadcasting from April 20 from a ship in international waters off China, the
Federation for Democracy in China said yesterday.

Wu'erkaixi, a leader of the pro-democracy student movement who now lives in
the United States, will head a team of young radio amateurs who plan to give a
                                             ^^^^^^^^^^^^^^
round-the-clock service that will reach all of Chinese territory.

The radio will broadcast on medium-wave from a 1,140 tonne ship formerly used
by Britain for geo-physical research.  It will be officially baptised the
Goddess of Democracy when it is launched from the French port of La Rochelle on
March 9.

The ship is being named after the version of the Statue of Liberty which
students erected in Beijing's Tiananmen Square beofore the tanks moved in last
June.

The launch will be broadcast by satellite.  International recording artists
are cutting a disc for the occassion and a world wide, 24-hour concert is
planned to mark the first anniversary of the massacre in Tiananmen Square on
June 4, the FDC said.

The FDC and the magazine Actuel sponsored the operation "Fax peace in China"
four months ago, whereby the democratic movement telefaxed documents to
machines capable of receiving them in China.  Beijing reacted furiously to the
initiative.

Some 15 European magazines are sponsoring the Goddess of Democracy.

The FDC was founded near Paris last November by dissidents from Beijing in
exile in France, the United States and elsewhere.

According to a freind, the "epoxy" is more a rubbery compond that can
be picked away and the mod done.

I'm not endorsing the mod, or claiming to have done it, I'm just pointing
out that the words "tamper-proof" should really be "tamper-resistant"....

Anyone have one of these Kenwood units and care to make any comments (good, bad or otherwise) about it?

Oh yeah while I'm already blabbering... is it true that the ICOM 24-AT CANNOT receive VHF & UHF simultaneously?

Thanks.

Some people are dyslexic and mentally cannot learn the code. I have two friends that barely made 5 wpm. One of them is now contributing to the hobby in a big way - he used to be a microwave engineer at Hewlett-Packard back when >1 GHz was leading edge. Both of these guys would have joined while in high school, had the CW requirement been eased.

> This "lower-the-
> water" instead of raise the bridge attitude just smacks of lack
> of dicipline.

I agree. Learning 5 wpm is just a matter of time and patience for most people. The difficulty is determining when someone has tried hard enough, then having the wisdom to "let them in" in spite of their not attaining 5 wpm. I'd rather give the VECs a little leeway here, rather than lowering the water level.

This is an emergency situation. For emergency communications, use any frequency and any amount of power you wish.

There are several commercially-available "medical alert" products out -

maybe a local hospital can help you there. The most reliable short haul communications is VHF, but doesn't work well around hills. You need line-of-sight to make it reliable. Portable cellular telephone is a possibility, if the tranciever is small enough.

Emergency use of an amateur 2 meter repeater is a possibility - you might want to contact a local amateur repeater group to see if it would suit your needs. I know that I wouldn't mind having the repeater used by an elderly lady with a broken arm. There are several commercially available walkie-talkies that can be easily carried, and the smallest batteries would last long enough.

Citizen Band walkie talkies would be ok about half the time. We're at the maximum of the sunspot cycle now, so I fear your mom's 5 watts would be drowned out by some clown in Louisiana running 2 kilowatts.

I currently hold an Advanced class license. Back when I lived in a house where I could erect a reasonable antenna, over 2/3 of all my contacts were on HF using CW. I've only ever worked CW on frequencies above 54 Mhz once :-).

Morse code has been a buddy. I don't use it at all now, but I'd hate to see it go. It seems that politcal conditions will conspire to retain CW as a prerequisite to legal HF operation for some time (maybe the next WARC will toss it out?). For illegal operation, CW does nothing. Any lid can dial 7255 on his TS-140S and jam WESCARS regardless of whether CW exists or not. It isn't the requirement of CW which has kept HF less prone to jamming than 2m, it is the relative cost and practicality of the equipment.

CW has been a like a secret handshake for hams. You don't need any computer gear to use it (unlike any of the other popular digital modes) and you can learn it easily. Every Field Day I've ever been to has had someone come driving in honking their horn "CQ FD DE W6CX" or something. At one time, CW was the appropriate requirement for entry into the amateur ranks.

But, the state of the art has really moved on, and we've got all sorts of new things to play with. CW has little to do with any of them. By easing the CW requirement and increasing the technical (theory) requirement, we could enjoy a new growth in the ham community which would benefit us all. Maybe then the secret handshake will be jargon like "Bell 202" and "HDLC" and "AX.25" and even phrases like "pseudo-noise transmitter". For folks who don't know or care about these things, it'll be like AM vs. SSB was, followed by AM vs FM. CW will continue to be one of the best high noise path modes, SSB will still be extremely popular, and the new modes will just be icing on the cake.

Why is it that the Canadian license was called "digital" when it in fact was really a "nocode" license?

How much effort was made by already licensed hams to get new hams to join the hobby?

Dissident group to broadcast from ship

A radio station calling itself the "Voice of Democracy in China" will begin broadcasting from April 20 from a ship in international waters off China, the Federation for Democracy in China said yesterday.

Wu'erkaixi, a leader of the pro-democracy student movement who now lives in the United States, will head a team of young radio amateurs who plan to give a
^^^^^^^^^^^^^^
round-the-clock service that will reach all of Chinese territory.

The radio will broadcast on medium-wave from a 1,140 tonne ship formerly used by Britain for geo-physical research. It will be officially baptised the Goddess of Democracy when it is launched from the French port of La Rochelle on March 9.

The ship is being named after the version of the Statue of Liberty which students erected in Beijing's Tiananmen Square beofore the tanks moved in last June.

The launch will be broadcast by satellite. International recording artists are cutting a disc for the occassion and a world wide, 24-hour concert is planned to mark the first anniversary of the massacre in Tiananmen Square on June 4, the FDC said.

The FDC and the magazine Actuel sponsored the operation "Fax peace in China" four months ago, whereby the democratic movement telefaxed documents to machines capable of receiving them in China. Beijing reacted furiously to the initiative.

Some 15 European magazines are sponsoring the Goddess of Democracy.

The FDC was founded near Paris last November by dissidents from Beijing in exile in France, the United States and elsewhere.

> Tests are imperfect ways to measure things. Would you feel much better
> knowing that Pilot's Licenses (including airline pilots) include
> multiple-choice, memorizable tests?

However, to put this in perspective, there is a difference between this situation and the written ham exam. Before you can take the Pilot's License written exam, you must have the approval of a Certified Flight Instructor. Such approval is not likely to be forthcoming until after extensive ground school training; with your Instructor satisfied you are knowledgeable and ready.

If we are going to rely solely on written knowledge testing for obtaining a ham license, and IF we want that test to be a valid measure of knowledge, than improvements in the tests need to be made. Some have noted that one can easily memorize the current answers to the tests. The problem is worst than that. Memorization is not required. The tests only require recognition. For example, do you want someone to pass a current written ham test with an hour of study? Try this: Get a copy of the current test question and answer pool, and type up all the answers on a separate piece of paper. Give that sheet of paper to someone with the instructions to read over the list, and if they recognize any of the answers on the test, then mark them as correct. I suspect they will pass without further study because of the poor psychometric qualities of the test. For example, few if any of the correct answers serve as distracters (i.e. where the correct answers are also incorrect answers to other questions).

I heard UHF air-to-ground communications during this morning's launch of Atlantis on its "secret" shuttle mission. I heard a total of four very brief transmissions, all on a frequency of 259.7 MHz (the "secondary" UHF comm frequency listed in the press kits). The first transmission heard here in northern NJ was at about 2:59:30 AM EST, and the last was at 3:01:14. The last message clearly said "APU shutdown on time"; this seems right given that the launch had occurred about 10 minutes earlier.

Among other things, my ability to hear the shuttle at this location confirms the high inclination orbit.

Anyone know about the "Message Transfer" or "Message Forwarding" feature now being touted in the upper-end answering machines?

I'm looking for a machine that will automaticly call my Bravo pager and send some pre-programed digits so that I know that a msg has been left on my machine. Specificly, will they send the extra digits after some delay after dialing the pager phone number, will they send the pound sign as the pager terminator, will they dial and alternate phone number, etc, etc, etc.

Being basicly a cheapo type individual, I am trying to save the $15 change that the pager company charges for voice mail/paging. I have a Code-a-Phone 2555 now. An antique I know, but has excellent audio quality and smooth remote control. Don't really want to give it up, but the monthly savings will soon pay for the handy, dandy, late model do-dads that are out in the high-end market.

E-mail fine but, if it will flow, let's do it here...   ...Mike

I have been receiving inquiries from people who own or are considering the purchase of an older Bearcat BC-300 scanner, so reposting this article seems like the right thing to do.

x

DON'T JUNK THAT OLD BEARCAT BC-300

by Bob Parnass, AJ9S

Although the Bearcat BC-300 scanner is no longer available, it occupies a fond place in my collection. I exercise little self control when I see a used BC-300 for sale cheap, and have adopted two broken units. They make fine radios after repair.

The BC-300 was the forerunner of today's 760XLT. It was a 50 channel feature laden scanner, introduced around 1979, back when Bearcat was part of Electra. Retail sales of the BC-300 continued until 1987, when it was discontinued by Uniden.

Although Electra offered the pricey BC-350 as a step above the BC-300, firmware bugs and a batch of bad power transformers doomed the 350, and the 300 remained the jewel of Bearcat line.

It's easy to see why the BC-300 model was offered for several years. It boasted premium features like a clock, a carrier operated solid state relay for tape recorder activation, a transmission counter, and a Service Search of 11 ROM banks of preprogrammed channels. For memory, the BC-300 used EAROM (electronically alterable read only memory), so backup batteries were not necessary. The Dog House, a radio shop in Fairfax, Virginia, at one time offered the DH 1000, a 1,000 channel adapter for the BC-300! Unfortunately for federal band listeners, the BC-300 lacked coverage of the 138-144 and 406-420 MHz bands.

While outwardly impressive, internal construction was typical of Electra hand wiring in that era -- a bit messy. BC-300 schematics show at least 100 components changed between earliest and later units. The scanner went through many circuit design changes, but rather than changing the printed circuit board, new components were tack soldered on the foil side in different positions.

Electra stamped all of its scanners with a manufacturing date code on the rear of the cabinet. The code is comprised of a single character (C = Cumberland, Indiana, P = Puerto Rico), followed by four digits denoting year and week the radio was built. For example, "P2284" denotes the radio was made in the Puerto Rico factory during the 22nd week of 1984.

Switching power supply failure was common in early units due to insufficient capacitance. Electra responded by increasing the value of capacitor C98 from 22 ufd/16 v to 47 ufd/25 v, but I recommend 47 ufd/35 v. If your display is getting abnormally dim, C98 is probably the culprit, as it was in five Bearcat scanners I fixed.

Squelch preset potentiometer R81, mounted on the radio circuit board, was misadjusted in new units, requiring readjustment after the components aged.

In one radio, I replaced Q9, a small signal PNP transistor. Its failure caused the BC-300 to become deaf on all but the UHF band. Failure of squelch gate transistor Q15 caused the squelch to remain open at all times.

Cold solder joints, especially on the wires and ribbon cable connecting the radio board to the logic board, have been responsible for other failures.

I have seen serious IC failures in three BC-300s built around 1984. These include CPU chip IC201, memory chip IC202, and IC203, not in stock at your your local Radio ShackO.

The BC-300 circuitry, especially on the radio board, is very similar to the circuitry in the the BC-220, BC-20/20, BC210XL, and BC-350, so some of the previous remarks may be applicable to these models as well.

I can neither furnish schematics nor repair your radio. If you come across a broken BC-300, obtain a schematic from Uniden and spend some time troubleshooting. If you give up, your BC-300 can be fixed by Electronic Repair Centers in Franklin Park, Illinois, (312)455-5105. I'm told they do good work. The BC-300 is a classic scanner and worthy of your efforts.

Looking at the schematic for the Bearcat 200XLT, Pin 8 is a switched Vcc line which supplies the K1013 chips. They are using it supply Vcc for a pullup line which drags the SKIP(NOT) pin of the high. The resistor which others say needs to be cut pulls the SKIP(NOT) line to ground (or low enough to look like a logic 0).

Other information in the schematic describes the SKIP(NOT) line as "with pull-up MOS". This suggests to me that the line has an internal pullup resistor, so that removing the 10K pulldown should be sufficient. But I'm not an engineer, so Grove may have its reasons. The added current drain from a 10K resistor is insignificant.

I don't know if you both have to be portable or not. If one doesn't have to be, it would be better to get an outside antenna 20 or 30 feet above the roof and connect the walkie talkie to it.

Brute force power is no substitute for a good antenna.

  I would buy the maximum legal power (which is 5 watts, I believe).
  The CB frequencies can have huge amounts of QRM, either local or
  via skywave. In fact, I wonder if a portable radio would be a reliable
  link over 2.5 miles, considering the potential interference.

If you stick the pins into a wet sponge whilst you're soldering on the
other end this is much less likely to happen.

Just to make this into a product review :) Are you adjusting these switches while the rig is transmitting or are the switches failing just by being in in the circuit?

The subject of "mod's" for the IC-04AT have probably been brought up before here on the NET, but for some reason I have managed to miss them all. So, if some kind ol radio amateur could dig in to his or her files one more time, and post them for me, it would be muchly apprieciated. I am specifically looking for the mod's that pertain to out of band operation, and RX audio volume improvement.

Please post or e-mail, and thanks.

We actually exchanged some mail. He really wasn't aware of the law, and it gave me a chance to put in a plug for a Tech license and 10 meters. He's pretty busy right now, but hopefully he'll get a chance to convert some old $5 CBs to 10 meters. I hope all you Ernies out there do what you can when a CBer comes around looking for the Bigger and Better Deal.

Honey works better than vinegar.

In article <488@ssc.UUCP> tad@ssc.UUCP (Tad Cook) writes:
]Pete Helme asked about saving money by buying ham gear in Japan.

My brother lives in Tokyo. He buys as much as he can, of electronics
and most everything else, in the US because it is cheaper to buy
it here and ship it there than to buy it there. His salary is
paid in Yen.

On the other hand, back in the early eighties I had him buy me
a TS-430 in Aki Habara (sp?) at a good price (~$600). I saw
IC-2's there for $140, but they could only be converted to US
bands with about $60.00 worth of crystals.

FCC Docket Number 90-55   Page 10

and reply comments on or before September 7, 1990. All relevant
and timely comments will be considered by the the Commission

before final action is taken in this proceeding. To file formally in this proceeding, participants must file an original and four copies of all comments and reply comments. If participants want each Commissioner to receive copies of their comments, an original and nine copies must be filed. Comments and reply comments must state the proceeding to which they relate (PR Docket Number). They should be sent to the Secretary, Federal Communications Commission, Washington, D.C. 20554. Comments and reply comments will be available for public inspection during regular business hours in the Dockets Reference Room (Room 239) of the Federal Communications Commission, 1919 M Street N.W., Washington, D.C. 20554.

29. In accordance with Section 605 of the Regulatory Flexibility Act of 1980, 5 U.S.C. & 605, the Commission certifies that these rules would not, if proulgated, have a significant economic impact on a substantial number of small entities, because these entities may not use an amateur station to transmit any communication the purpose of which is facilitate the business or commercial affairs of any party. See 47 C.F.R. & 97.113(a). Moreover, the proposed rules would not require the use of or significantly enhance the sale of any additional amateur station apparatus.

30. The proposal contained herein has been analyzed with respect to the Paperwork Reduction Act of 1980, 44 U.S.C. & 3501 et seq., and found to increase the information collection burden which the Commission imposes on the public. This proposed increase in the information collection burden is subject to approval by the Office of Management nd Budget as prescribed by the Act.

31. A copy of the Notice will be forwarded to the Chief Counsel for Advocacy of the Small Business Administration.

FEDERAL COMMUNICATIONS COMMISSION

Donna R. Searcy
Secretary

APPENDIX

Part 97 of Chapter I of Title 47 of the Code of Federal Regulation is proposed to be amended as follows:

1. The authority citation for Part 97 continues to read as follows:

Authority citation: 48 Stat. 1066, 1082, as amended; 47 U.S.C. & 303. Interpret or apply 48 Stat. 1064-1068, 1081-1105, as amended; 47 U.S.C. && 301-609, unless otherwise noted.

2. Section 97.9 is revised to read as follows:

& 97.9 Operator License

(a) The classes of operator licenses are Communicator, General, Advanced, and Amateur Extra. There are also two grandfathered classes of operator licenses, Novice and Technician. An operator license authorizes the holder to be the control operator of a station with the privileges of operator class specified on the license. The license document or a photocopy thereof must be in the personal possession of the licensee at all times when the person is the control operator of a station.

(b) A person holding a Communicator Class operator license and who holds a CSCE indicating that the person passed element 1(A), 1(B), or 1(C) is authorized to exercise the rights and privileges of the Technician Class for the duration of the license and renewal thereof.

(c) A person holding a Novice, Technician, Communicator, General, or Advanced Class operator license who has properly filed with the FCC an application for a higher operator class that has not yet been acted upon, and who holds a CSCE indicating that the person passed the necessary examinations within the previous 365 days is authorized to exercise the rights and privileges of the higher operator class.

3. Section 97.17(a) is revised to read as follows:

& 97.17 Application for new license.

(a) Any qualified person is eligible to apply for an amateur service license. No new Novice or Technician Class operator licenses will be issued.

* * * * *

4. Section & 97.119(e) is revised to read as follows:

& 97.119 Station Identification.

* * * * *

(e) When the control operator is using privileges on the basis of holding a CSCE, an indicator must be included after the call sign as follows:

(1) AC for Communicator Class Operator;
(2) AG for General Class Operator;
(3) AA for Advanced Class Operator;
(4) AE for Amateur Extra Class operator.

* * * * *

5. Section 97.301(a) is revised and a new paragraph (g) is added to read as follows:

& 97.301 Authorized Frequency Bands.

* * * * *

(a) For a station having a control operator holding a Technician, Communicator, General, Advanced or Amateur Extra Class operator license:

Wave-length band	ITU Region 1	ITU Region 2	ITU Region 3	Sharing requirements See & 97.303 Paragraph:
VHF	MHz	MHz	MHz	
1.25 m	---	222-225	---	(a).(b).(e)
UHF	MHz	MHz	MHz	
70 cm	430-440	420-450	420-450	(a).(b).(f)
33 cm	---	902-928	---	(a).(b).(g)
23 cm	1240-1300	1240-1300	1240-1300	(j)
13 cm	2300-2310	2300-2310	2300-2310	(a).(b).(j)
-do-	2390-2450	2390-2450	2390-2450	(a).(b).(j)
SHF	GHz	GHz	GHz	

9 cm	---	3.3-3.5	3.3-3.5	(a).(b).(k).(l)
5 cm	5.650-5.850	5.650-5.925	5.650-5.850	(a).(b).(m)
3 cm	10.00-10.50	10.00-10.50	10.00-10.50	(b).(c).(i).(n)
1.2 cm	24.00-24.25	24.00-24.25	24.00-24.25	(a).(b).(i).(o)
EHF	GHz	GHz	GHz	
6 mm	47.0-47.2	47.0-47.2	47.0-47.2	
4 mm	75.5-81.0	75.5-81.0	75.5-81.0	(b).(c).(h)
2.5 mm	119.98-120.02	119.98-120.02	119.98-120.02	(k).(p)
2 mm	142-149	142-149	142-149	(b).(c).(h).(k)
1 mm	241-250	241-250	241-250	(b).(c).(h).(q)
---	above 300	above 300	above 300	(k)

* * * * *

(g) For a station having a control operator holding a Technician, General, Advanced or Amateur Extra Class operator license:

Wave- length band	ITU Region 1	ITU Region 2	ITU Region 3	Sharing requirements See & 97.303 Paragraph:
VHF	MHz	MHz	MHz	
6 m	---	50-54	50-54	(a)
2 m	144-146	144-148	144-148	(a)

6. Section 97.501 revised to read as follows:

& 97.501 Qualifying for an amateur operator license.

An applicant must successfully pass an examination for the issuance of a new amateur operator license and for each change in the operator class. Each applicant for the class of operator license specified below must pass, or otherwise receive examination credit for, the following examination elements.

(a) Amateur Extra Class operator: Element 1(C), and elements 3(A), 3(B), 4(A), and 4(B);

(b) Advanced Class operator: Element 1(B) or 1(C), and elements 3(A), 3(B), and 4(A);

(c) General Class operator: Element 1(B) or 1(C), and elements 3(A), and 3(B);

(d) Communicator Class operator: Element 3(A).

7. Paragraphs (b) and (c) of Section 97.503 are revised to read as follows:

& 97.503 Element Standards.

* * * * *

(b) A written examination must be such as to prove that the examinee possesses the operational and technical qualifications required to perform properly the duties of an amateur service licensee. Each written examination must be comprised of a question set as follows:

(1) Element 3(A): 60 questions concerning the privileges of a Communicator Class operator license. The minimum passing score is 45 questions answered correctly.

(2) Element 3(B): 25 questions concerning the additional privileges of a General Class operator license. The minimum passing score is 19 questions answered correctly.

(3) Element 4(A): 50 questions concerning the additional privileges of an Advanced Class operator license. The minimum passing score is 37 questions answered correctly.

(4) Element 4(B): 40 questions concerning the additional privileges of an Amateur Extra Class operator license. The minimum passing score is 30 questions answered correctly.

(c) The topicls and number of questions required in each question set are listed below for the appropriate examination element:

Topics	Element: 3 (A)	3 (B)	4 (A)	4 (B)
(1) FCC rules for the amateur	15	4	6	8

radio services				
(2) Amateur Station operating procedures	7	3	1	4
(3) Radio wave propagation characteristics of amateur service frequency bands	4	3	2	2
(4) Amateur radio practices	11	5	4	4
(5) Electrical principles as applied to amateur station equipment	6	2	10	6

8. Section 97.505(a) is revised to read as follows:

& 97.505 Element credit.

(a) The administering VEs must give credit as specified below to an examinee holding any of the following documents:

(1) An unexpired (or within the renewal grace period) FCC-issued Novice Class operator license: Element 1(A) and the 30 written questions in Element 3(A) based upon the material from the written examination passed for the Novice Class operator license.

(2) An unexpired (or within the renewal grace period) FCC-issued Communicator Class operator license: Element 3(A).

(3) An unexpired (or within the renewal grace period) FCC-issued Technician Class operator license: Element 3(A).

(4) An unexpired (or within the renewal grace period) FCC-

issued Technician Class operator license issued before March 21, 1987: Elements 3(A) and 3(B).

(5) An unexpired (or within the renewal grace period) FCC-issued General Class operator license: Elements 1(B), 3(A), and 3(B).

(6) An unexpired (or within the renewal grace period) FCC-issued Advanced Class operator license: Elements 3(A), 3(B), and 4(A).

(7) A CSCE: Each element the CSCE indicates the exmanee passed within the previous 365 days.

(8) An unexpired (or within the renewal grace period) FCC-issued commercial radiotelegraph operator license or permit: Element 1(C).

* * * * *

9. Section 97.507 is revised to read as follows:

& 97.507 Preparing an Examination.

(a) Each telegraphy message and each written question set administered to an examinee must be prepared by a VE holding an FCC-issued Amateur Extra Class operator license. A telegraphy message or written question set, however, may also be prepared for the following elements by a VE holding an FCC-issued operator license of the Class indicated:

(1) Element 3(B): Advanced Class operator.

(2) Elements 1(A) and 3(A): Advanced or General Class operator.

(b) Each question set administered to an examinee must utilize questions taken from the applicable question pool.

(c) Each telegraphy message and each written question set administered to an examinee for a Communicator, General, Advanced or Amateur Extra Class operator license must be prepared, or obtained from a supplier, by administering VEs according to instructions from the coordinating VEC.

(d) A telegraphy examination must consist of a message sent in the international Morse code at no less than the prescribed speed for a minimum of 5 minutes. The message must contain each required telegraphy character at least once. No message known to the examinee my be administered in a telegraphy examination. Each 5 letters of the alphabet must be counted as 1 word. Each numeral, punchuation mark and prosign must be counted as 2 letters of the alphabet.

Seems to me that the "No-code" gang has no further need to whine. O.K. you win. I "worked" for the Novice ticket at the age of 8 and passed on the third try. I could copy 12wpm, but the theory was tough at that age. The only privs a novice had then was CW. The "Incentive" was there 2 years later to upgrade to Advanced and get voice privs. 20 years later, a friend of mine from Iran managed to learn 5wpm and pass the Technician class in three weeks even though English is not his primary language. I'm sorry folks, I just can't help but feel that Morse Code is only a barrier to getting into Amateur radio if you have "NO DICIPLINE". I have never had anyone approach me wanting to get into radio that just could not get the code. A six year old can do it (i did), non-technical folks can do it (my friends have) so what is the problem here??

If you want to "experiment and pioneeer" the advance of radio technology, I see nothing wrong with requiring a little history lesson (how we got to packet) with regards to one of the most commonly used transmission modes in the world. This "lower-the-water" instead of raise the bridge attitude just smacks of lack of dicipline. This lack of dicipline thing has bothered me for some 10 years now. I don't think CW is a "lid-filter" because the lids have gotten in. This constant berating of the "O.F.s" and "Their code" sounds alot like the disaster on 14.325 as of late.

I guess I am just nostalgic, things used to be so genteel and polite on the air. Over the last decade, I have kissed 15 and 20 meters away. Goodbye old friends, THEY have moved in. I find myself spending more and more time these days using CW because you can almost go back to a time of courtesy and dicipline there. It is still hard to scream and rant in CW and the OFs that use the code just seem to be less prone to lidness (notice i said less prone, not imune). The WARC bands are another place of solice, where we OFs go to chew the rag endlessly while one of those #$#%$ contests are trashing the other bands.

While I conceed that the Communicator class was inevitable, and there seems to be no REAL good argument against it, I just can't explain the terrible forboding i feel. Its not as if things will go BANG and get bad, they have been getting bad for many years now. I just can't help but think that this attitude and lack of dicipline will accelerate the degradation that has already begun.

Which band do we kiss off next??

de km4jn
(o.f. for 22 years).

I have heard this discussions along the way before about posting executables and source code. Maybe some of you are priveledged in being allowed access to the sources and binary groups, However, many companies squash them. According to one SA, users tend to keep their own copy of the source/exe and then lots of copies exist wasting system space etc.

I would hope that those rare occations that source/exe are shipped along with this news group, or somehow a mailing list for it. I have quite a job ahead of me to retrieve these files if their posted elsewhere (execpt ibm.binaries). I had to make specail arrangements for that. (Iwish I could ftp but...)

Anyone got any better ideas??

I desire to use a pair of portable CB radios as an emergency communication system. The area in which they are to be used is rural and rather hilly and I need to have a reliable range of 2.5 to 3 miles between units.

Can anyone help me to know what kind of wattage I would need ?

Further details of the application and questions follow.

Three years ago my mother had a heart attack and was advised to "take nice long walks as part of her recovery and treatment. This winter, while out walking, she slipped and broke her arm some distance from the nearest house. While this was not life threatening it caused her some distress.

I am hoping to give her a light portable CB which she can use to summon help from home (my dad) and it should have a range of 2.5 to 3 miles (reliably).

Question is what wattage should the units be ?
Is there a formula for wattage to range conversion ?
Are US CB radios different from British ? (FM vs AM ?)
  (There's certainly a difference in price.)

Thanks for any help you can give ...   Ken   mtdca!kwmc

Yeah, I also heard this guy with his MFJ "Junk Net"

What bothers me is that my DX Callbook does not show any V31BB in it, although there are lots of other V31 stations, and that I *never* heard any other stations talking to him. Regardless of MFJ quality, is this guy a nut case, or what? Anybody got the scoop?

MONDAY FEBRUARY 26, 1990

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world on UseNet and Amateur Packet Radio. It is available for UNLIMITED distribution.

* SAREX-2 TESTING CONTINUES *
=============================
Last week, the Shuttle Amateur Radio Experiment #2 (SAREX-2) packet radio station underwent extensive testing at the Marshall Space Flight Center in Huntsville, AL according AMSAT Area Coordinator Ed Stluka (W4QAU). This

testing was being perfomed in conjuction with the training of STS-35 Payload Specialist Ron Parise (WA4SIR) in the use of the ASTRO-1 experiment which will be primary payload on that shuttle mission. The primary payload, ASTRO-1, will be used to conduct a number of astronomical experiments. During the several days of testing this week, radio amateurs in the Huntsville area were invited to connect to WA4SIR and to receive a QSO number.

This special packet radio station flying on STS-35 on May 9, 1990 will give each radio amateur who connects to WA4SIR a QSO number confirming their contact. When the connecting station sends their QSL card in with this contact number, they will receive back a beautiful QSL card commemorating this HAM IN SPACE shuttle flight. The SAREX-2 packet radio station consist of a Motorola 2M FM H/T with 5 watts ouput, a Heathkit HK-21 TNC-2, and a GRiD laptop computer that has a 40 MB hard disk drive to store the calls of all the stations connecting to WA4SIR during the nine day mission. The specially written software which will be running the SAREX-2 packet station is designed to allow for completely unattended operation and logging of the calls of all connecting stations. It will also prevent duplicate QSO numbers being sent! Although no digipeating will be allowed through SAREX-2, connecting to this packet station will be like any terrestrial packet contact. Just use your TNC along with your 2m tranceiver, and everything else is the same. After you have connected and received your QSL number from WA4SIR, on subsequent orbits you can watch for the SAREX-2 message beacons being sent periodically. The message beacons will contain information about the flight of STS-35 and other interesting items.

Look for more information about the SAREX-2 mission in AMSAT News Service (ANS) bulletins and on AMSAT HF/VHF nets in the next couple of months. For more specific information about the ASTRO-1 payload, contact the SPACELINK BBS at (205) 895-0028.

Well, here I go again. If we had *decent* public relations (i.e. advertising)), then John wouldn't have had to ask at least questions 1-3. When are we collectively going to realize that it's not whether or not we have a no-code license that's going to "save ham radio" but rather public awareness of who we are, what we do, and how important we are to the country! Hell, look at the latest W5YI report. The FCC's newest commissioner, Sherrie Marshall, couldn't even get the ARRL's name right. Maybe *that* will finally get the League to spend some $$ on PR instead of the "Star Wars" W1AW (before you flame, yes, I know it was financed with donations).

Regarding the front-end problems at OSU:
It sounds to me like you have problems both
with intermod and simple front-end overload
(padding 30 in front of the RX cleared up the problem
and you could still hear the TX).
Rather than helical resonator(s), which are a little
small at 450 MHz and thus hard to build by hand, I
would recommend a 1/4 wave cavity filter.  You can
build one out of hardware store plumbing parts and
hobby brass tubing, plus a couple of connectors.
Nothing to it, and the cost should be about $2.  It
ought to give you 30db out-of-band rejection.

     Does anyone have any experience with this? The problem is
```

that in the way the PTT is on the ICOM 2AT, its not compatible with the TNC's output.

My question is: who has done the correct interface as reccommended by Heath (using 3:1 audio transformer), and does the transformer have to be 3:1, or would an ordinary 1:1 work? (I'd wind one, but I don't have access to torodial cores.)

Thanks ....

```

```

Hello All,

I have just moved the wb3ffv ham bbs to a new location, so see the attached information for the new dialup information...

```
+-------------------------------------------------------------------------------+
        HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!
```

I have placed a BBS system on-line that is mainly oriented towards the Amateur Community (but there is other stuff on-line). As of now I have not attempted to promote this system any place except in the amateur channels (PACKET, USENET, & word of mouth), and will continue under this policy, as I hope to keep it oriented toward amateur radio. The various software for

UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through user support I hope to keep the latest and greatest ham software on-line. Below is the information that is needed in order to access the BBS via Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs
Number: (301)-625-0817 -- 1200 & 2400 (Non-MNP)
Number: (301)-625-9482 -- 1200 & 2400 (MNP5), 4800 & 9600 V.32 (V.42/MNP5)
Number: (301)-625-9663 -- 1200 & 2400 (MNP5), 9600 & 19200 (PEP)
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.0.1 {wb3ffv.ampr.org} [for FTP access on 145.550 mhz ONLY]
Misc. Info: Machine is an 80386 computer running UNIX V.3.2 and features 700 Meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage all to upload anything new that they come up with, as it is of benefit to all. Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release)
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.12)
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx, 10.xx)
MSYS BBS for the PC running KISS TNC's (Version 1.07)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01)
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /usr/spool/uucppublic. To retrieve the files listing just use the following command:

```
uucp wb3ffv!~/FILES /usr/spool/uucppublic
```

This will move a copy of my files listing into your uucppublic directory. If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

RTTY DX Notes, 1of3, 2/23/90

RTTY DX Notes For Weekending 23rd February 1990
Part 1 of 3.
BID: $RTDX2302

During the week a packet station was seen on 14064 KHz, while another has taken up residence on 14083 KHz. 21077 KHz has also received a visit, but i believe that was to tell the W1AW code practice to "Get Off My Frequency". One wonders what communications has been reduced to?

Our thanks this week go to I5FLN, JA1BLV, JG1NBD, OD5NG, TG9VT, UT5RP, VK2EG, W1DA, and W6/G0AZT. Thanks chaps for your interest and help.

RTTY DX Notes For Weekending 23rd February 1990
Part 3 of 3.
BID: $RTDX2502

Having problems with QSL for UO5OK? Try sending them via UT5RP. Dima can get the cards for you.

Notes of Interest:

KL7JAF/C6A will be in the Bahamas until the end of the month.

JH1LBR will sign T32LB from March 22nd until 27th.

IS0XV (Spratley) is still planned for 15th March through 30th March. If you wish to send donations we will advise you shortly. In case of cancellations all donations will be refunded.

OH2BH with some YV operators will be active from Aves Island (YV0) for one week about mid March. Martti will be going to Jarvis Island and Conway Reef later in the year.
JA3AUQ will be in 8Q7 (Maldives) from 27th February until 4th March.

RW3DX informs us that he will be going to Vietnam (3W) around the 13th of March, with UA3DK and UA3DZ. The calls will be 3W3DX, 3W3DK and 3W3DZ. QSL RW3DX to Box 145, Dubna, 141980 USSR, and UA3DK and UA3DZ via Box 45 Dubna 141980 USSR.

It is reported that all Russian amateurs who hold first category of radio station license will be permitted to use packet, SSTV and RTTY from March 1st without having to obtain prior permission as has been the case up until now.

EA9JV reports that the Western Saraha (SO) DXpedition is still on, and should appear around the first week of March with the callsigns of SO1EA, SO2EA, SO4EA and maybe SO1LYNX. QSL to The Lynx DX Club. EA9JV also says that he is trying for 7X for a one week stint after the Western Saraha operation. More later.

GL DE DX1 (VK2SG).

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

I am sysop on a 220 Mhz repeater in San Diego County. We have had the Advanced Computer Control's RC-850 repeater controller online since 1987. I'm looking for anyone with experience with the same controller. I have found numerous bugs with the firmware and would like to discuss mutual problems.

We started with firmware version 3.41 and upgraded to 3.42 as soon as it was released. The revision was nice in many respects but somewhat clunky in others. We are runnings the 850 with the voice option, no DVR, UF functions in latched, 3 remote bases, control receiver, home-brew autopatch at the site and 1 remote auto-patch using firmware support of REMOTE PHONE 1.
Overall, we have been very pleased with system even with some of it's shortcommings. I have talked to ACC by phone a few times about the clunker bugs, but they were'nt to concerned by them and, I doubt, that they even logged them for fixes in later releases.

I would now be interested in a MS-DOS based controller with voice support.
Anybody want to comment on this aspect of computer-controlled Ham repeaters.

Thanks, 73's

        ...Mike

I have a Fujitsu Ten 450-470 commercial tranceiver (model # FTM40-3092H). This is a 16 channel scanning synthesized mobile radio.
I'm looking for a way to be able to program the radio down into the ham band. It currently on 453 Mhz. I have the programming prom for the radio and, of course, it will not allow entry of freqs below 450. I called Fujitsu and you can guess what their response was after they figured out that I had a programming prom. So here I am. This is a nice radio and I only have limited use of it in the commercial segment. If anyone knows any way to get around the programming restriction, I'd appreciate any responses.

Not until the no-coders have their way, have successfully joined up with
the FCC in jamming no-code down our throats, and the bands are overrun
with the "freebanders" instead of the technical whizzes they
comtinuously hold out as the no-code ideal - in short, after it kills
ham radio - will that dawn on them. Unfortunately, it'll be too late.

Does anyone know of statistics concerning users of INFO.HAMS ???

It would be interesting to know the following info. :

1. How many are on the mailing list.
2. Breakdown by state/country
3. Breakdown by institution (University, Government, Military, Industry)
4. How many links to local BBS's

etc...

73's to all,

> Phil Howard has just proposed a new ham licensing structure.
> He claims that it contains ONLY FOUR license classes, but then provides for
> FOUR levels of code proficiency within each class.

I am using the FCC's concepts. They have 4 classes and at least 5 "class combinations". I am only extending the concept they started.

> If I had to enter these classes into a data base, I would find that there are
> SIXTEEN different combinations. To my mind, Phil has proposed a structure
> with SIXTEEN CLASSES, NOT FOUR. I see no diference between endorsements and
> additional classes. They both result in a record-keeping zoo.

Yes, this is correct. The FCC is going to have some sort of zoo on their hands no matter what is done UNLESS they abandon incentive licensing now.

> You may note my recent proposal which resulted in REALLY only four classes,
> which some of you might want to increase to five to allow a "low-tech
> with CW" entry path.
>
> My classes were:
> Extra (as at present)
> Basic (13 wpm CW, present General AND Advanced, with Advanced privileges)
> Technician (Same theory as Communicator, but with 5 wpm code)

> Communicator (No code, moderate theory)
> to which you COULD add
> Novice (5 wpm, simple theory, non-renewable)
>

> the time. BTW, there were no other technical people (or hams) in his family.
>
> I DON'T THINK WE NEED AN EVEN MORE COMPLEX LICENSING STRUCTURE. MOST COUNTRIES
> GET BY WITH FEWER CLASSES THAN THE US.

True. And we don't need much more than 2 levels. However as long as we have incentive licensing, and those who now have "turf" they will surely want to protect, we have a big hairy ball of wax on HF.

However, we do need to have a VHF-up class that has ALL privileges above 30 Mhz. I mean ALL as in NO EXCEPTIONS. There is NO REASON that CW should be required for access to 6 meters or 2 meters, nor for a maximum of 1500 watts, nor for repeater/beacon/auxiliary control op privileges, when some other VHF-up privileges don't require it. All the stated reasons for a no-code license apply to ALL privileges above 30 Mhz.

What I tried to come up with was a way to get that in there.

Bob's suggestion is a good one; don't get me wrong. It is worth writing your comments to the FCC (re: 90-55) and suggesting. I put forth yet another such proposal. You should suggest any or all that you feel are worth suggesting.

I would be satisfied with the only VHF-only class having ALL privileges above 30 Mhz, but I MUST INSIST that the exam for it be NON-trivial. It should have no less than 250 questions from a pool of 2500. However such a license class is more appropriate for the techno-nerds who use 1500 watts, work EME, and are repeater ops, than for "public service" and other kinds of people. The latter group can live with 200 watts and no repeater op privs. They should get access to 2 meters, though. THIS IS WHY ULTIMATELY WE DO NEED TWO CLASSES OF NOCODE LICENSE (though 2 is the maximum needed).

LET TECHNICIAN BE A NOCODE LICENSE CLASS, TOO !!

That leaves 4 more classes in the FCC database. I invite other ideas on how to arrange and structure the classes. If we limit ourselves to just THREE levels of HF privileges, then we can cross combine the possibilities (2x3) and have 6. However, General and up should have all VHF privs anyway, so the numbers are less, still. Try working it out for yourself. BE SURE TO LEAVE NOTHING OUT, or else suggest that it be abandoned (and why) if you do.

Artech House Books. (1-800-225-9977) publish:
"Filters with Helical and Folded Helical Resonators" by Peter Vizmuller.
(0-89006-244-7)   C9244 $54.00

You may be able to get this from your local library (If its good).

Digi-key sell some helical resonators by toko at 70cms. They are designed
for small receivers and so have a reasonably hign insersion loss (5db for
the three stage ones!). If you want low loss you just have to make them
big (and silver plated). This doesn't sound like a problem in your application.
I would sugest you borrow a network analyser to line it up.

Also check out the RSGB VHF UHF Manual by G.R. Jessop G6JP. A really
excellent book and has a couple of pages on helical resonator design.

Hi y'all! Has anyone had any experience hooking up a David Clark headset to an Icom ham handheld? Apparently, Icom makes a special interface in two different versions, but being an adventurous type, well, ok, cheap actually, I'd like to save myself the $50 for the lower priced of the two and try and make one. The headset is the DC 10-20, which uses a dynamic mic, so the mic needs some kind of bias voltage at the minimum, if not an entire pre-amp section. That's about all I've been able to figure out. Thanx!

73,
Arun

A few years ago when I was in Germany, I visited a ham (with whom
I have since lost contact) over there. Of his equipment, some
equipment which stood out to me were a couple of QRP handheld
HF transceivers for CW which were made by some Japanese company
which I have never heard of before (and can't remember the name,
either!).
  Anyway, there are apparently several models for different
bands, from 40 meters through 10 meters, each monoband.
I plan on doing a several week hike in the Sierras this
coming summer and I am looking into the possibilities for
ham equipment to take along. My VHF/UHF handie wouldn't
work in valleys (most of the trip!) and my Heathkit HW-8
is a little big and heavy to be carrying around for weeks.

So... does anyone have any info on this kind of HF QRP
rig? Mfgrs, availability, price, etc??
  Thanx & 73!

> Digital licence holders - grandfathered to ADVANCE

Not to my knowledge from both talks with a radio inspector and the last offical update on the new licencing.

Digital Licence holders will be deemed to hold the new basic amateur certificate and the advance technical certification. They will only be able to opperate above 30 mhz. using all modes etc.. The{y must pass the 5 wpm or 12 wpm test to operate below 30 mhz. (HF).

WD2F asked about extending coverage on the Uniden HR2510 and 2600. That only worked on the early model 2510 that did not have the potted processor chip. All it took were a couple of pull up resistors. The later 2510s and the 2600 are set up so that they cannot be put on CB.

I've put together the following listing in response to requests here on the net for information on amateur radio programs for the Macintosh.

This is a one-time posting on my part. If someone would like to volunteer to keep this information updated, I'd be happy to send him or her the background materials I have. It would be even better if that person was also on packet radio; when I had a packet system up and running, I noticed frequent Macintosh questions there, too. (If anyone wants to post this listing on packet, go ahead. But I'll leave it to you to take out the prices, divide it into smaller chunks, etc.)

Please note that I am not endorsing or recommending any of these programs. In fact, I've only seen a few of them. The information in this list was gleaned mostly from flyers supplied by the software vendors, or in some cases from reviews or listings in QST or AMSAT Journal. Please check with the vendors for the latest product details, pricing, etc.

And--this should be obvious--this listing has absolutely no endorsement by Apple Computer, Inc.

Having said all that....enjoy!

73,
Patty

****
Macintosh Amateur Radio Software
List compiled by N6BIS, 2/25/90

PACKET RADIO

NET/Mac (KA9Q TCP/IP)
Supports AX.25 and NET/ROM as well as TCP/IP functions. Requires a TNC with KISS mode.
Doug Thom, N6OYU, 1405 Graywood Drive, San Jose, CA 95129. Send formatted 800K Macintosh disk with stamped, self-addressed return disk mailer. Also available via anonymous FTP from apple.com (/pub/ham-radio); on the Digikron Systems BBS at (408) 253-1309; and on the WB3FFV BBS at (301) 625-0817, 625-9482, and 625-9663. The program is copyright, but free for noncommercial use.

MacRatt with FAX
Terminal program for use with AEA's PK-232 multimode controller. Supports packet, CW, RTTY, AMTOR, and facsimile. Includes computer-to-TNC cable.
Advanced Electronic Applications (AEA), PO Box C-2160, Lynnwood, WA 98036. $59.95

MORSE CODE PRACTICE

N6MZV Morse Trainer
RT Martin, N6MZV, 10382 Orange Avenue, Cupertino, CA 95014.
Also available via anonymous FTP from apple.com (/pub/ham-radio).
$25.00

Morse Tutor
Jack Brindle WA4FIB, Brincomm Technology, 3155 Resin Street, Marietta, GA 30066. Send formatted 800K Macintosh disk with stamped, self-addressed return disk mailer. The program is copyright, but free for noncommercial use.

MacMorse
David A. Kall, 700 Marine Parkway #314, New Port Richey, Florida

34652. $29.95

Zihua Morse
Zihua, P.O. Box 51601, Pacific Grove, CA 93950. $39.95 without speech synthesis; $65 with speech synthesis.

RTTY

MacTTY
Summit Concepts, Suite 102-190, 1840 41st Ave., Capitola, CA 95010. $39.95

LOGGING

LOGic
Personal Database Applications, 2634 Meadow Bend Court, Duluth, GA 30136. $75.00

FDLog!
System One Control, 3900 85th Ave N, Suite 200, Brooklyn Park, MN 55443. $29.95

SATELLITE TRACKING

QuikMac
AMSAT, PO Box 27, Washington, DC 20044. $40 for AMSAT members; $50 for non-members. Requires Microsoft BASIC.

Satellite Orbit Prediction Program
Macintosh conversion of W3IWI program.
Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015. Send formatted 800K Macintosh disk with stamped, self-addressed return disk mailer; or send SASE for source listing. Requires Microsoft BASIC.

MacSat
BEK Developers, 1732 74th Circle NE, St. Petersburg, FL 33702. $10.00

Satellite Helper
MacTrak Software, PO Box 1590, Port Orchard, WA 98366. $59.95

Satellite Pro
MacTrak Software, PO Box 1590, Port Orchard, WA 98366. $99.95

PROPAGATION, GRAY LINE, DX HEADINGS

DX Window
Creates on screen an azimuthal equidistant projection (great circle)

world map centered on your QTH, with day/night terminator.
Engineering Systems, Inc., PO Box 939, Vienna, VA 22183. $39.95

Skycom 1.1
Enter solar flux and get propagation predictions to desired areas of the world.
Engineering Systems, Inc., PO Box 939, Vienna, VA 22183. $39.95 ($59.95 with Skycom 1.5)

Skycom 1.5
Provides sunlight status at both ends of the path; MUF, F0F2, and FOT frequencies; S/N ratio of the link, and other information.
Engineering Systems, Inc., PO Box 939, Vienna, VA 22183. $39.95 ($59.95 with Skycom 1.1)

DX Helper
MacTrak Software, PO Box 1590, Port Orchard, WA 98336. $34.95

Sun Clock
Desk accessory. Displays a map of the world with day and night areas.
MLT Software, PO Box 98041, 6325 SW Capitol Highway, Portland, OR 97201. $17.00

RADIO CONTROL

ICOM IC-735 Control
KE6FG Software, 9763 Pali Ave., Tujunga, CA 91042. $49.95

TEST PREPARATION

Ham Stacks
HyperCard stacks containing all of the questions in the current question pool for each license class.
Diana Syriac N1GZS, 49A Meadow Pond Drive, Leominster, MA 01453. Send two formatted 800K Macintosh disks with stamped, self-addressed return disk mailer. Also available via anonymous FTP from apple.com (/pub/ham-radio).

COLLECTIONS AND MISCELLANY

"Project Mac"
Contest logging, antenna design, satellite tracking, clip art, etc. Microsoft BASIC required for many (but not all) of the programs.
Stan Horzepa WA1LOU, 75 Kreger Drive, Wolcott, CT 06716. Send three formatted 800K Macintosh disks with stamped, self-addressed return disk mailer.

Amateur Radio #1
Contains satellite tracking, Morse code practice, Ohm's law calculator, and pad design programs.

Kinetic Designs, PO Box 1646, Orange Park, FL 32067. $4.00

Red Ryder 9.4
Terminal emulation program, suitable for packet radio.
Kinetic Designs, PO Box 1646, Orange Park, FL 32067. $4.00

MacScience BBS
Various ham-related applications, including antenna design, propagation, WEFAX, packet, and Morse code. (408) 866-4933.

Digikron Systems BBS
Various ham-related applications, including logging, propagation, Morse code, and packet. (408) 253-1309.

WB3FFV BBS
Various ham-related software, including packet, contesting, and Morse code applications. (301) 625-0817, 625-9482, and 625-9663.

MacNet
Public-domain programs (currently on nine disks) contributed by Macintosh packet users. Includes test preparation, contest logging, propagation prediction, satellite tracking, and amateur television.
John D. Seney, KB1HE, 144 Pepperidge Dr., Manchester, NH 03103. Send formatted 800K Macintosh disks with stamped, self-addressed return disk mailer. Contributions of public-domain programs encouraged.

Apple II Amateur Radio Software
List compiled by N6BIS, 2/25/90

PACKET RADIO

PACHAM
Uses a two-microchip interface instead of a TNC.
DaJu Development Company, 39 Long Ridge Road, Carlisle, MA
01741. $49.95

MORSE CODE PRACTICE

Morse+Plus Morse Code Tutor
EPO Software, 7805 NE 147th Avenue, Vancouver, WA 98682.
$15.95

MORSE CODE & RTTY OPERATION

HAM
Sends and receives both Morse code and RTTY.
DaJu Development Company, 39 Long Ridge Road, Carlisle, MA
01741. $49.95

Code Machine
COTEC, 13462 Hammons Ave., Saratoga, CA 95070. $29.95 (discount
if bought in conjunction with another COTEC program)

RTTY Machine

COTEC, 13462 Hammons Ave., Saratoga, CA 95070. $29.95 (discount if bought in conjunction with another COTEC program)

SATELLITE TRACKING

Apple QuikTrak
AMSAT, PO Box 27, Washington, DC 20044. $25 for AMSAT members; $35 for non-members

ANTENNA DESIGN

Antenna Design & Dimensions
EPO Software, 7805 NE 147th Avenue, Vancouver, WA 98682.
$9.95

Antenna Trap Designing
Larry East W1HUE, 119-7 Buckland St., Plantsville, CT 06479.
Send formatted disk with stamped, self-addressed return disk mailer.

LOGGING

Sorry to have to tell you, but welcome to the world of ACC! Most firmware
revs. seem to introduce more bugs than they fix, and ACC is not very
helpful. The first answer is denial, second is that your site is the only
one experiencing the bug. When pressed, they give the "don't have the resources"
to fix it right away answer, and when they finally fix it, the cycle restarts.

Personally, I think their code has been patched & mutated until it is unstable,
and unmaintainable.

The least expensive S-COM has technical features & sw capability that only
the RC-850 (top of the line has), and packaging on the 85 is poor, to say the
least. Things like minimal audio adjustments on the 85, which results in what
we call "ACC syndrome". (15kc deviation on the voice ID when Adjusted for
normal 5kc repeater audio. The fix is to tack an extra pot onto the pc board.)

We won't even talk about the DVR, and allthough the ICOM 900 remote base
feature is nice, it still has severe quirks that can cause it to lock up.

I am sure this will bring out the ACC defenders, who love the features, but
I have had my fill. (85,850,dvr,IC-900 remote)

To answer your question, a local ham Dan wb4pyl developed a nice PC based
controller/autopatch/DVR that has been used in atlanta for 12-18 months.
I don't know the status of his sw/hw regarding purchase, but you may
want to drop him a line. (..!gatech!kd4nc!wb4pyl)

I am sold on S-COM for most purposes, but am also interested in PC based
controllers.

73 & good luck with ACC.

Well, here we go again. All of the folks from the university radio clubs come out of the woodwork. We all seem to agree that it is difficult to keep such an organization going. Apathy and a general lack of time and funds are all great contributors. I know; we have the same problems here.

Earlier this year/semester there was quite a bit of talk on the net about a nation-wide organization of university clubs that had existed at one time. In the past there had also been a net of sorts on 20 and 40 meters. As far as I know that all fell apart over the summer. (Summers sure have a way of disturbing the continuity of club activities....) Perhaps getting on the air with a net once again can be at least a bit of an incentive to keep things going in the university community. I think there have been at least 4 separate responses to the original post. I know there are at least 10 or more schools with clubs that I have seen on the net. I had discussed this a bit with KA9WGN (Phil - I hope I got the call right....) and we discussed the possibility of a 10m net to allow participation by the Novice/Tech persons as well. I propose that we attempt to convene a net this comming Saturday, 3/3 on 28.425+- at 1800Z. I realize it may be rough on 10, but lets give it a try. If anyone has any better time/freq suggestions, I would like to hear from you. We can always try some other bands in the near future.

I will volunteer to try and call the net from Wash U club station W0QEV. Any university clubs, individuals, or interested parties are welcome. Please be persistent in calling and we will try to pick everyone up via relays if need be. If this works out, we can try it each Saturday.

73 and see you on the air...
Scott

(Phil - can this be relayed to HAM-UNIV?)

I have often been frustrated while trying to explain to the less intelligent/inexperienced why ham != CB or why my handie-twinkie and an HF rig are both part of the hobby. However, the funniest such occasion in recent memory occurred when a woman I once dated got into my car and asked me about my handheld lying on the seat. I proceeded to give her a cursory explanation of the hobby and why I had the radio.

She then said, "Oh, so who has the other one?"

Scott

Thank you.

Well, as a matter of fact the Digital Amateur class has not proven to be particularly popular. That's too bad. Perhaps it wasn't given enough "airtime" :-) (that is, enough publicity), or perhaps it's because it never reached critical mass. After all, our amateur population is spread out over a much larger area than the American ham community - and the Digital class is restricted to 2 meters and up. This means there's not many other stations within shouting distance.

As an example, this weekend I drove down to Lake Louise from well north of Edmonton (and back the next day - 675 km each way). There's a repeater in Athabasca, 3 in Edmonton, two in Red Deer, and one in Rocky Mountain House. I heard 4 other hams during the whole trip, and worked one (for about 2 minutes). That's on 2 meter voice. Didn't hear a single packet during the whole 14 hours, and I was all over the band. Not much encouragement, is it?

Some of the repeaters were trunked together, too; I was listening to 1000's of sq. km. worth of country, and never a peep. And I know I was getting out; the id's/squelch tails on those repeaters were about all I did hear. Sigh. Maybe the old boys don't want to chat with ve6pdq? (I'm not serious.)

And as far as getting a large number of new hams, I don't know what it would take. Dynamite the commercial TV stations, maybe ?? ;-).

Hello there.

I just recently started reading this group lately to see what the noise level is up to.

Anyway, just a simple question. About a year ago, Los Angeles County abondened their old 39meg assignments and jumped up to 470ish or so mHz. In that wake, they should have left behind a few hundred (if not a thousand) or so GE 'low-band' radios (the Mocom 70-like variety, for those of you who can remember those old Motorola tanks). Does anybody know what L.A. County did with all those radios. Usually, they're auctioned off unless another agency needs those type of radios. They also had a bunch of MX-300 series HT's for their (again) old 490mhz assignments, though those might have been retuned down to 470, or given to LAPD, since they used the same series on their HT's, though LAPD HT's are 'turkey callers' (Auto ID'ers), and LASO's were not.

These GE monsters should be good for 6m, and they were 6-channel models, so that should be plenty for the fairly empty vastness of 6m...... [That should be good for a flame or two].

Hmmmm??? Anybody know?

Check out Radiokit. They have several. A friend bought one, and said
it was going together slowly, due to problems. They have a couple of
20 meter rigs, and a 15 meter, CW only, I think.

There's also an ad in CQ, page 49 in March, from Digitrex, showing a
8x2x6" multiband CW/SSB rig. If you get more information on this, I'd
be interested in hearing about it. I called them once, and they said
it was a super-het receiver.

As I understand it, the Canadian Digital class was restricted to packet only, i.e. no voice privileges to support coordinating and setting up packet operations, or just getting in contact with the rest of the ham population.

A lot of the 2 meter voice operation here is actually people talking about packet, and helping one another get set up and finding out what TNC settings they had wrong, etc.

I know I would not have had a Digital class license were I to be a Canadian citizen.

I have heard a number of about 1 watt per mile over fairly straight terrain for somewhat reliable communications, but have the following observations:

> If the terrain is NOT ideal (i.e., hills block RF wonderfully), you will have to up the power (sometimes considerably).
>
> Why fool around? In an emergency, I would think that the driving force would be reliability rather than cost.
>
> You will probably want to look for which channel is not heavily used, since the less interference will extend the perceived range. (Your signal will have less to contend with.)
>
> The maximum power level for CBs is extremely limited. I beleive the limit is still around 5 watts.

Based on this, I recommend that you go for a system of the full limit on allowed power (5 watts if you can), and then TEST THE SYSTEM by walking around (or having her walk around) and talk back to the base operator.

If that does not work, you may want to try a few things:

Get your base antenna (I hope you use as high a power station as allowed at the base too!) as high up as you can - definitely above the house roof.

If this still does not provide adequate coverage, you will have to go to another whole system: either cellular phone or have two people go for their ham license and use a ham repeater (hams can use higher power than CB operators).

The alternative of course is to warn her that the CB communication system only can be heard from such-and-such a distance.

Where there is a will, there is a way....

Subject: Vietnam Radios

I've just finished reading a couple of books on the Vietnam war ('Chickenhawk' and 'The 13th Valley'). In them they mention two radios used, one was the

PRC-25, and the other was the PRC-70 (apparently this had some sort of scrambler built in). Does anyone have any more info on these; size, power, frequencies, etc.

Matt Brunton,
NERC Computer Services, Swindon, England.

Due to the problems with the chicken banders modifying these rigs for CB/"freeband" use, the FCC made Uniden epoxy all PLL/VCO areas of the boards to prevent tampering. They also decreed that all future designs (2600?) be tamper proof as well. A copy of the service manual is available from Uniden for $20.00, but again, all current units will be epoxied.

I used one of the MFJ clocks and didn't find any problems whatsoever with it.
I have also used the MFJ Noise Bridge and got excellent readings (as compared
to a professional unit) with it. Likewise, I had an MFJ-1274 (TNC2 clone)
and it worked flawlessly for three years, at which time I sold it to upgrade
to a Kantronics KAM.

I have a hard time understanding why people are so harsh on a company whose
workmanship may not be the best, but is certainly acceptable for Amateur Radio
work. Hams seem to have this extremely cynical attitude towards outfits
like MFJ and Radio Shack ("Rat Shack"). These outfits don't claim great
mean time between failures or anything of the sort. They are just trying to
provide products to electronic hobbyists at reasonable costs. And for what
I usually need, they suit me just fine.

Remember, you *usually* get what you pay for.

In article <5710006@hpcvra.CV.HP.COM> gregm@hpcvra.CV.HP.COM (Greg May) writes:
]
]   Helical Resonator Question......
]
]I have a challenge for the masses on the net.....
]
]Here's my situation. The local club is trying to put up an autopatch
]on the local OSU 2M repeater, and we have run into a snag --- mainly "too much
]RF" from other sources on the hill. There is all kinds of stuff up there
]including a channel 7 TV signal, channel 25 and various sheriff repeaters,
]etc......
]
]Using a "hot" Hamtronics receiver on the hill and a 5 element beam as our
]link "to the hill" (because of the cost of "out of the way phone lines"),
]we are able to get a very solid signal to the hill. Using a handheld, the
]signal is perfect. Unfortunately, the Hamtronics likes all the other signals
]up their too. There is all kinds of intermod junk comming out of the 450
]receiver and audio "junk" is passed on the the 2M repeater input.
](The 440 handheld can also hear this stuff with squelch open --Heathkit)
]Now, we have found that with all the filtering (power lines, etc.) that 30db
]of attenuation on the front end of the 450 receiver (outside the box) cleaned
]up just about all the intermod (yes, you can still hear the 450 uplink).
]I personally did not hear this demonstration, but the general feeling in the
]group was that the helical resonator was the way to go. (My guess is we
]are running out of link signal at 30DB, and it is starting to get noisy.)
]We cannot/don't want to increase the 450 uplink signal at the transmitter.
]
]Now, the challenge for those who dare... Does anyone have information where
]I can get my hands on some articles to educate ourselves on these resonators.
]They sound interesting. I have one article but feel that I am still in the dark
]about the building technique. I think this would be the perfect opportunity
]for another club project.

Your problem is not unusual. The art of getting repeaters to work
in a high RF environment is not trivial. Let me suggest the following:

(1) If the intermod is being generated in your receiver, you have three possibilities: (1) Get a better receiver, such as a commercial radio (we use Micor's); (2) Put selectivity in front of your receiver (more on that later); (3) Use PL tones on your receiver so that it won't unsquelch on intermod.

(2) If the intermod is being generated in your transmitter, you have one choice: FIX IT! Any transmitter generating intermod at a significant level does not belong on a crowded site. There are many commercial operators who oppose ham repeaters on commercial sites because hams often put up piles of junk that generate intermod. There are two techniques that come to mind for fixing intermod generating transmitters: (1) selectivity between the transmitter and the antenna; (2) use of a circulator so that signals cannot enter the transmitter and be mixed.

(3) If the intermod is being generated elsewhere, you need to find it and then fix it. Intermod is generated by any nonlinear device. We had one bad case that consisted of a guy cable rubbing against a struct. It was fixed by bonding it to the struct. We have another on a tall building in Phoenix (valley center) that comes from a section of the concrete parapet that was replaced with concrete built over a stretched metal frame, and the intermod comes from the rusting metal. We have been unable to fix this one!

Helical resonators, cavities, crystal filters: all narrow band devices. The standard for repeater sites is to use resonant cavities. These can be purchased (not cheaply), and have adjustable insertion loss and frequency. You can get pass or notch cavities. You should have a pass cavity on your transmitter (to be a good neighbor - it keeps the broadband noise from the transmitter from getting too far away from your frequency). A pass cavity (or more - in one case we used 5) on your receiver is a good idea, and will greatly help if the intermod problem is from within your receiver.

You can also use attenuation on your receiver. A third order intermod product will go down 3 dB for every 1 dB of attenuation that you put in front of your receiver. Of course, you don't want to use much attenuation on a repeater receiver.

I can give you more details by email if you want.

Let me re-iterate: If you are operating a ham repeater on a busy site and you don't have a circulator and a pass cavity on your transmitter, you are not being a good neighbor. If you try it at almost any site in Arizona, you will be shut down by the site owner (usually USFS or BLM) when they discover it. It is not "good amateur practice" to leave out these items on a shared site.

This is fortunately incorrect. Canadian Digital Amateur privs include
[AFP][0-59].* (in other words, all known modes) from 2 meters up. Below
2 meters, on the other hand, we have no privs whatsoever.

Regarding the last postings about helical resonators:

I remember a very nice article in the May '81 Annual Antenna Issue of "Ham Radio" about homebrewing cavity resonators. (There was an interesting suggestion how to make a "quick and dirty" cavity resonator for 2m. using an empty coffee can, a couple of coax connectors and other pieces of junk...).

The article may be usefull and include extra references.

Hope this will help.

(I'm recalling the year and month of the magazine from the doldrums of my memory... It used to work fine, but you know... Anyway, I'll double check the info later on at home, and publish an errata if the info is incorrect.)

A couple of weeks ago I posted a list of equipment manufacturers addresses and phone numbers. The intention was to disseminate the information, and to encourage anyone with further information to submit additions and corrections. There has been a little discussion about the availability of the information.

Some part of the material I listed, some of which had been compiled on a local system by one of the local club members, was taken from another source which should have credited Peter W. Kemp, KZ1Z, for compilation.

Please consider this a public apology to Mr. Kemp for not having properly credited him for his contribution. If you have downloaded a copy of the list, will you please add his name as a major contributor. If you have distributed the list to another board, will you please also copy this apology to that board.

I did not intend to slight Mr. Kemp for his due credit, but I was not at all diligent in tracing the source of the information. For that I apologize to him and to the Amateur Radio community.

Apparently the INFOHAMS posting appeared on CompuServe, either in the form of INFOHAMS DIGEST or otherwise. (I have not been on CompuServe for a while, so I do not know what form it took there.)

Please direct all questions or comments about items 11 through 22 on the list to:

Peter W. Kemp, KZ1Z

To the original poster who mentioned hand-held QRP sideband rigs: I don't know what Japanese company makes them, but AEA sells two VXO'd SSB/CW HTs for 10 meters and 6 meters. I had the 10M unit, and I'm sorta sorry I sold it. My first QSO outside the store was a W6 in San DIego. Pretty good for 2 watts two years ago.

Doug Faunt mentioned Digitrex. I've had their 9-band QRP rig on order since last October. Digitrex's ham business is a sideline to their instrumentation business, so things don't happen too fast there. The 9-band rig is a successor to their earlier monobanders, with selectable CW/DSB, digital readout, direct conversion recieve and 0-15W input. For the price (175 kit/ 250 assem.) it looks pretty good, if and when it comes out.

They've had a few problems they've been correcting based on feedback from the beta-test units in the field. There was a 31-meter image problem, and now there's a redesign of the final network going on. If everything is corrected and no other problems show up, I should have mine in about a month, I hope. I'll post a review if and when.

BTW, they make a couple of other nice products. One is a pocket sized freq counter for $60 (about .75"x1.5"x2") and a similarly sized one-channel rock bound FM 2M transmitter, intended to be used with scanner as an ultra simple 2M system. Might be interesting as the heart of an ultra-tiny packet system, too.

You understand WRONG!

A Digital certificate holder has all modes (including A1) on 2m
and up. They also get to do nifty things like P[0-9] that I, as
an Advanced certificate holder, can NOT do.

Hello Folks,
What is the best way to measure harmonics of radio gear? The ARRL handbook (1987 version), says that the best way is an attenuator in series with the COAX line from the Radio to the Spectrum Analyzer or by using a Dirctional Coupler.

Frankly I would be happy to measure in any way, but I do not own a attenuator that will take 100 Watts (let alone 1000 Watts) or a directional coupler.

Is there other ways that will yeild accurate results? I have thought about using a piece of wire wraped around the COAX, but this method is not accurate since the wire can go resonant at some frequencies (or can go more resonant), and yeild results that indicate the harmonic content is more than the fundamental.

I know that BIRD makes a high-power directional coupler, who knows what this costs. I was thinking of building a RF coupler that has been shown in the ARRL handbook that is used for SWR/Wattmeters....

What do you folks think? Any good sources for cheap test equipment like this?

DE KJ6NN
Phil
Thanks in advance!

Agreed, but why is a code test the ONLY way to "work" for a license? In this day and age a tougher technical exam makes more sense.

>
Malaysia followed the footsteps of Britain (being its former colony). So the
exams are twice a year based on the City and Guilds R.A.E.  This in itself
slows down the process of recruiting new hams.

Interestingly enough, my first ticket was obtained here and I just applied for
the 9M2 call from here.  All the above actually discourages people from taking
up the hobby.  There are about 200 hams compared to a population of 15m.
Hams are considered an elite group or "bourgoise" unfortunately.

The question was asked about using a TI 99/4A on packet. In addition to the 99/4A you need:

RS232 (either card in PEB or old sidecar version)
Terminal Emulator (TEII will work but is not very useful, TELCO is better)
Disk controller
32K memory
Disk Drive
Editor/Assembler or Extended BASIC cartridge (to run TELCO)
TNC

Yes it used to be that you had to go to a British Telecom office to take the code test. Now, you can take the test (by appointment) with the RSGB at many radio rallies. 12WPM gets you your HF privileges.
I wouldnt go as far as to call the CEPT license 'bureaucratic' - after all, it

IS valid in most European countries! No hassle about reciprocal licensing
when you go to France for the weekend.

After reading the flamethrowers on here I'll say this:
There are a few here that not only want no-code but also no-test.
Fine. Glorified CB is all that will become of this once great hobby.
I'm reluctantly in favor of no-code but frankly, two things will
happen: 1- Anarchy will be victorious on the bands
2- The idiots that think it's funny to jam and make raunch
noises on thier rigs will ruin the public service end
of ham radio.
Like on the UHF/VHF bands where patches to police are commonly made so
some jackoff decides to fart and do whatever and use obscenities
towards the police officer on the other end...and they certainly
don't like it. When the FCC takes away the ham bands like they
might just do someday, the jammers will still be there...making
havoc and otherwise showing their gleuteus maximiuses.
I'm being grim but hopefully the no-code thing will pass and or die
and whoever the new amateurs may be will be welcomed into the hobby
like others were (like me).

The TNC-1 has a modem "breakout" connector which allows it to operate with an external modem. You can check out this interface in the manual and schematics. In addition to this, provisions have been made to double the clock frequency of the 6809 to give more processing power, but this requires the "B" version of the MC6809 (MC68B09) processor and peripherals. You may even consider using the Hitachi 63B09 CMOS 6809. Since other timing parameters are settable using commands, the TNC-1 should take you to 9600 baud without too much problem. For a while, the FADCA and K9NG modems were available to experimenters which allowed 9600 baud operation. You may be able to find more info in the ARRL Networking Conference papers from about 5 years ago on all these topics. Sorry I cannot be more specific, but I don't usually have my TNC at work! 73 and CUL..........de WD5IBS (proud owner of 2 original TNC-1s!)

I don't think 'feeling terrible' has ANYTHING to do with knowing or not knowing
Morse Code. I know the code and rarely use it. I haven't been in that
isolated situation of someone being trapped, as I'm sure 90% of us haven't.

>
>Maybe I stated my opinion poorly, but all I am trying to say is: there are

They aren't abolishing it, they are just making an entry license...without
code.   From what I read of it, the no-coder can take the 5wpm and get his
tech...which I think is good..give them a LITTLE taste, then they'll want
more. And if they dont want more, then we're no better or worse off than we
were before...

Rich and others:

OUTSTANDING. You've got it almost completely correct. Your one error is in the red green blue bit. Notice from your photo that the beginning is the sync. AT the end of the line is the colorburst. This is a straight NTSC picture that has been digitized by a board that fires on the vertical sync. The picture you have put up as a postscript file is WEBER Photo-9 and is picture of the limb of the earth. The satellite is still spinning down and even though it takes only a 30-th of a second for a NTSC frame, how many of you have tried hand holding a camera for a 30-th of a second still shot? As the bird slows down and locks magnetically (the rest of them have just done this and WEBER has greater moments of inertia and more mass to despin and lock), the pix should not smear as this one has. In your Postscript photo, any detail was washed by this spinning other than the atmosphere along the earth's limb is clearly visible. You should see it in color ;-). Soon, soon. Rich, I will post the color decoding formulas so that you can do a little trigonometry and recover the color information. The lines are NOT sent alternately RGB, it is NTSC (Bleeccccchhhh!).

Great work!!!

Bob

Any one with information on software, public domain or otherwise, for an IBM PC
which will turn it into a keyer would be appreciated.
Either leave a note or look for me around 14.010 - 14.025 @ 0100-0300Z most
evenings.

I purchased my IC-32AT in Hong Kong. The only problem I ran into
was the fact that they use 430-440 for their "450" band (actually
it was rig to be used in Australia, according to labeling on the
box). I think Japan has the same 430-440 band. Upon returning
to the US, I called Icom and learned that it was no problem to
convert it to 440-450. 2 weeks and $50 later, I had my rig back.
I think it was worth it - even with the conversion cost, I was
still $150 ahead of the going price here.

Rich:

One more error you made, ALL lines are sent, you have just been unlucky
and have missed those times when the passes were transmitting the lines.
Once again, ALL lines are transmitted. I wondered why your weber.ps
looked so flat ;-). At any rate, an outstanding job. Amateur inventiveness
never ceases to amaze me. That is what these satellite projects are all
about.

DEVON: Just average four pixels and use four color representation. To bad there is no good black and white on the commodore but you can always use a B&w TV. A two level representation is not gonna get it, so give up the resolution for another two levels.

Bob

```

Here is the postscript for PHOTO-9, the only WEBER photo so far that has anything resembling anything.

The header to the picture is:

Picture was taken Sun Feb 18 04:53:08 1990
as picture #09 from bank #1 addresses 0095:00FF to 0000:2DF2

I believe that this put satellite somewhere over north east India. My guess is that the picture is of a land mass, not the edge of the earth (as it might appear).

I'm also guessing about the aspect ratio -- I've used approximately 645/242 which might be right...

```

Interestingly, when I was getting upgraded from Tech to General I meet a lot
of people who had big problems with the Technical side and had no problems
with the code at all.

The problem with all of up "TECHO-WEENIES" is that we are spoiled. We work every day on technical problems and do not have to worry about the other areas. Such as writting, art, music, style. When a techincal problem is solved on a computer, Microwave device, Chemical compond or whatever. We do not have to write an Essay on how the problem was solved and its impact on society. The people who do that may not even understand the technical problems or the device.

It took me 4 months to get up to 13 WPM with 30-60 minutes of study +EVERY+ night. I passed the techical tests the first time with 1 week of study (I am up to Advanced now, I was a General for 1 week). But for me to get up to 20 WPM would be another 4 month effort, so right now that is not as important as other things in my life... I also saw people on the other side who were trying very hard to get the technical stuff done, but had the code complete (up to 20 WPM in some cases) but could not get past Tech.

I know this is hard to believe when you had now problem with the technical side. How much trouble do you think morse code is for a farmer (who had no engineering training) vs. the Technical side? I would conclude that the technical side was very tough, while the code came easy...

The point of all of this is the following:

Morse code is not a filter, just like the technical side is not a filter. The two forms help ballance the Ham community. I would sure hate to spend all day working on computers and then come home and talk about that all night...

So all of you who want to get a license do it... If you do not want to spend the effort (on the code or the technical) then be quiet.

You can ofcourse wait for the world to change and then you can try to become a ham...

DE KJ6NN
Phil

> side.

This is how it was for me when I developed an interest in ham radio. I recall being frustrated that there was a step from Tech to General that only required code proficiency (something I was good at) but no such step up from my Novice license.

I remember asking how I should go about learning "the theory" and I got anwers like "read the ARRL Handbook." Yeah. Go find a 1972 era Handbook and read the first paragraph (I believe it's about electromagnetic waves or something) from the perspective of an eight year old. Right. I didn't even know what a lot of the words meant.

I believe that some of the technocrats occasionally lose sight of the fact that ham radio is a multidisciplinary endeavor. What first sparked my interest is that I could take a box of junk (say, a Viking Navigator) and make "wireless" contacts. It wasn't until after about five years of hamming that I started to develop interest in learning how the junk worked.

End of anecdote. Begin opinion.

And now for my contribution to the rekindled (*sigh*) code/nocode debate. If testing for amateur licenses is to include some variety of lid filter, be it a code test, a rigorous technical exam or whatever it takes to filter out lids/undesirables/criminals/whatever, it should be most rigorously applied to those who are permitted to use the 50 MHz band and down. Why? Because booish behaviour on these bands has the potential to wreck havok worldwide.

Personally, I don't think a rigorous technical exam would be enough to discourage someone talented and motivated enough to build a station capable of upsetting people worldwide on 1296.

     It took two months worth of listening to W1AW over summer vacation
     to pick up 13 wpm.  If I had to do it now, it would take longer as
     I now know to "question authority" ;-)

>Morse code is not a filter, just like the technical side is not a filter.
>The two forms help ballance the Ham community. I would sure hate to spend
>all day working on computers and then come home and talk about that all
>night...

     What people are saying, IMHO, is that ham radio needs technical
     people to grow.  And that technical training is part of our charter
     to start with.  Morse is a skill that is arguably less useful than
     it was say 40 years ago.  Though, metaphorically speaking, most
     no-coders I know will not begrudge people who collect antique radios
     their rights up until the point they claim all people should use
     antique radios :-)

>information, state by state; whatever happened to that?

Well, if they are I should correct some erroneous info I popped into
this thread last week. In Nova Scotia the callplates are available
without fee the first time and without any extra annual fee's either. If
you require replacement plates (ie for damaged ones) then the cost is
$10.The person to whom the vehicle is registered must be the licence
holder to get call plates.

I sincerely hope Bill Gunshannon is correct in his opinion that there won't be another grab for 6. While past attempts have failed, this is by no means a guarantee that they won't succeed in the (near) future. Radio doesn't change, but the people who use it and the people who make decisions do. We are all witness to the No-Code situation. Things WILL change when enough noise is made by one side, coupled with the slowly-dying noise level from the other side.

I was mildly surprised at the number of responses I received after I suggested that Hams ask for the space between 28 and 50. Apparently there is quite a bit of activity in there. When the available commercial space has dwindled to nil I think we can exect another attempt to get 6 meters. WARC is not a guardian of ham bandspace, and the loudest voice (usually the one with the most money) will prevail as it has in the past.

I still think we Hams could do worse than ask for more of that space; even if it is only a "best defense is a good offense" move.

I have been duly firebombed by my condesending attitude for my post predicting the demise of 6 meters.

I freely admit my tone was inappropriate. I maintain that the communicator proposal is as much a political manuver to reallocate 6 meters as it is an honest attempt to help ham radio.

Michael

* SAREX-2 TESTING CONTINUES *

HR AMSAT NEWS SERVICE BULLETIN 049.01 FROM AMSAT HQ
SILVER SPRING, MD FEBUARY 18, 1989
TO ALL RADIO AMATEURS BT

Shuttle Amateur Radio Experiment #2 Undergoes Testing in Huntsville, AL

This week the Shuttle Amateur Radio Experiment #2 (SAREX-2) packet radio station underwent extensive testing at the Marshall Space Flight Center in Huntsville, AL according AMSAT Area Coordinator Ed Stluka (W4QAU). This testing was being perfomed in conjuction with the training of STS-35 Payload Specialist Ron Parise (WA4SIR) in the use of the ASTRO-1 experiment which will be primary payload on that shuttle mission. The primary payload, ASTRO-1, will be used to conduct a number of astronomical experiments. During the several days of testing this week, radio amateurs in the Huntsville area were invited to connect to WA4SIR and to receive a QSO number.

This special packet radio station flying on STS-35 on May 9, 1990 will give each radio amateur who connects to WA4SIR a QSO number confirming their contact. When the connecting station sends their QSL card in with this contact number, they will receive back a beautiful QSL card commemorating this HAM IN SPACE shuttle flight. The SAREX-2 packet radio station consist of a Motorola 2M FM H/T with 5 watts ouput, a Heathkit HK-21 TNC-2, and a GRiD laptop computer that has a 40 MB hard disk drive to store the calls of all the stations connecting to WA4SIR during the nine day mission. The specially written software which will be running the SAREX-2 packet station is designed to allow for completely unattended operation and logging of the calls of all connecting stations. It will also prevent duplicate QSO numbers being sent! Although no digipeating will be allowed through SAREX-2, connecting to this packet station will be like any terrestrial packet contact. Just use your TNC along with your 2m tranceiver, and everything else is the same. After you have connected and received your QSL number from WA4SIR, on subsequent orbits you can watch for the SAREX-2 message beacons being sent periodically. The message beacons will contain information about the flight of STS-35 and other interesting items.

Look for more information about the SAREX-2 mission in AMSAT News Service (ANS) bulletins and on AMSAT HF/VHF nets in the next couple of months. For more specific information about the ASTRO-1 payload, contact the SPACELINK BBS at (205) 895-0028.

If you try to call Kenwood's service department by phone long distance, be prepared to pay a phone toll just to find out the line is busy.

This is because Kenwood has one of those wonderful systems that prompt you to enter the code number for particular departments. Thr trouble with these things is that you can make a lot of phone calls you have to pay for before you ever get in.

THIS is the reason that I no longer buy Kenwood gear.

A friend advised me that the new Japanese ham radio satellite FO-20 had had its on-board BBS activated, so I tuned it in and here's what I saw during one pass this evening.

I don't know much more about this than what you see here, but I thought I'd share the session to get more people interested.

Equipment used to receive this was the TAPR PSK modem kit attached to my R-7000, and a 30-element circularly-polarized beam. The TNC was an MFJ 1270 with the PSK modem plugged into it. 435.910 is the downlink freq, +/- 9kHz of doppler locally. I'm told that this modem does the special Manchester-encoded AFSK needed to uplink, but I haven't tried that yet.

Anyway, here's what one pass looked like:
          - Brian

> I have been waiting to see just what the FCC really said regarding the proposed codeless class license. Since I have never followed NPRMs very closely before, I wonder if some of you could answer a few questions.
>
> 1. How long does it usually take for the summary of the NPRM to reach the Federal Register? I have not seen it in issues up through 2/12/90.

It usually takes a few days at least. I have seen things take more than a week to make it into the FR.

> 2. How detailed is the summary of the NPRM published in the Federal Register? Does it describe the exact changes proposed to part 97, or will it be a general statement such as the press release posted to the net earlier?

It is usually plenty detailed for our purposes. It is better than a press release.

> 3. How does the "complete text" of the NPRM differ from the summary? Would it be worthwhile to order the "complete text" of the NPRM from the Commission's copy contractor? Have any of you ever done this?

It may or may not be worth it to you. The complete text contains all the material prepared by the staff, and often includes many referenced items.

I did order the complete text and original petitions for 87-14 from the copy contractor. It was useful info at the time, but I doubt if I will need it for 90-55.

In article <1681@aurora.AthabascaU.CA> lyndon@cs.AthabascaU.CA (Lyndon Nerenberg) writes:
>And considering that hardly anyone builds their own gear any more,
>I think the very idea that someone "needs" the electronic skills to
>pass the technical portion of the exam to be granted an EXTRA is
>old-age thinking.

Lyndon, we've discussed this point in the past. The fallacy in the "so, why not a no-theory license?" argument is the following:

Yes, it's certainly possible to operate a modern radio with very little knowledge of electronic theory. Hundreds of thousands of cops, firemen, security guards, mobile phone users, etc, prove this every day.

But the real question is whether one would be able to contribute to the basis and purpose of the amateur service without some knowledge of electronic theory. I certainly don't want to dismiss the public-service aspects of amateur radio, but it's clear to me that amateur radio's real payoff to society is on the technical side. Not in the direct "spin-off" aspects (though they do exist) but rather in the opportunity that amateur radio gives people to learn about electronics and communications and to encourage them to apply their skills to a socially useful career.

Phil

Several people who have additional information about the WEBER picture
format have let me know that there are a few errors in my original
posting. Most importantly, the data is not RGB. It is just straight
color NTSC sampled at three times the color burst frequency. It is
theoretically possible to separate the chroma information from the
luminance, but it's going to take some effort.

Secondly, it seems that even-numbered frames are occasionally
transmitted. I'm still trying to figure out when. It's difficult to
get a lot of data to analyze since the passes are so short and during
the week I miss the morning passes.

In the future I will not post the sources to rec.ham-radio since it gets
automatically forwarded to INFO-HAMS. I'll post to one of the usenet
source newsgroups and send a note to rec.ham-radio.

Is there anyone out there who is presently using a Kenwood TS-440s and
any of the newer TNC/TU's like a KAM or PK-232 ? I'm considering various
hookup schemes and was wondering how you are doing it. Are you going in
the AFSK ports on the back or are you using ACC-2 ? Are you muting the mike
on the back connector etc. Any help would be appreciated. I hope to be

up on all mode HF soon.

Thanks

/ hpfcmgw:rec.ham-radio / jokim@jarthur.Claremont.EDU (John H. Kim) / 12:28 pm Feb 19, 1990 /

Recently, on TV, I saw someone using a radio controled (RC) airplane with a video camera mounted on it.   .... I came up with what I think is a rather innovative use for this (well if you must know, as a spotter plane for deep sea fishing-- .... etc...

```
--
John H. Kim                   | (This space to be filled when I
jokim@jarthur.Claremont.edu | think of something very clever
uunet!muddcs!jarthur!jokim  | to use as a disclaimer)
----------
```

My question is.... if you are a few miles out to sea, where ya gonna take off and land. And what happens if and when the plane engine qiuts and it is quite far away from the boat. You'll get tired of tossing about $1-$2 kbucks in the ocean every so often.

A friend of mine has a 'copter and I figured out that we could use one of the CCD video chips and all the support electronics stuff.
I thought that a modified UHF tuner pack (one of those old kind with all the open air tuning caps) could be fixed up for about 75 milliwatts at ~600 mhz. We could FM the signal out and have the appropriate demodulator at the recieving end (sattelite tuner section). All this stuff, lense, video electronics, uhf transmitter, and battery would weigh about 2 pounds.

That's a lot of weight for a small aircraft to lift. So that means that to get any type of performance, we'd need a larger 'copter. That's ok but a fully loaded 'copter will cost a lot of money.   Fixed wing craft that isn't used for aerobatics is another situation.

It was only an idea, but it would have worked.

As far as being leagel.... well.... the emission was within the 100 miliwatt power requirements for liscense free operation, at the time.
I think that the current spec may be a radiated emission of within 10,000 microvolts field streingth at 1 meter.
(Right, like everyone is going to figure out how to measure this).
The frequency and details of transmission didn't matter here in Coloradio since there is little UHF TV activity and we wouldn't have interfered.

As far as a liscense is concerned, you don't don't need one for low power transmitters (less than 1/10th of a watt). However, this power level may not suit your needs and since you will probabily want to go with, say 5 watts of power to get any kind of range on the transmitter, and since this is going to be used for commercial fishing (you will get paid for supplying information) you are looking at another can of worms altogether. A ham liscense won't allow you to use your radio communication for profit or gain.

'Nuff from me for now

John Wells (WA0LHB) in Ft. Fun, Coloradio

I'm sure we're all geting tired of the same repetitive arguments over code vs no-code, especially with the FCC Proposal in the open now. Two points keep rising to the top:

1) CW acts as a filter to keep out the "undesirables" who would turn ham radio into another CB world. Bullshit. What WILL keep them out, if anything can, is that ham equipment generally costs a lot more than CB gear. What created the big rush to CB was the popularization during the 70's by TV shows and songs like "Convoy". Every wanted to run right out and prove that they could be just as "country" as the next guy. I put a CB rig in my car as I did a lot of travelling at the time, and I wanted emergency communications available, and it was CHEAP. For $60.00, I was up. Of course, the thing was almost always useless because of the incredibly low signal/intelligence ratio.

As long as ham gear costs more than CB gear, we have little to fear. Besides, no one is seriously proposing elimination of all testing requirements, or even for code to acces HF bands.

Off the wall question: Where did -13- WPM come from? It's an unusual number for speed in a decimally oriented society (or are we, given 12 in/ft, 3ft/yd, etc.) Why not 5 WPM, 10 WPM, and 20WPM, (assuming a requirement)?

2) The FCC will turn against hams if we fight to no-code license and take away our allocations. Several people asked for some reference to FCC policy. I don't have the archives handy, but several months ago, when no-code was hot and heavy, there were quotes taken from the former FCC chairman that put forth that position rather explicitly. I believe either Phil Karn or Phil Howard might remember it.

What is important to remember is that useable spectrum is finite, and the FCC is faced with a growing demand for access to it. Given the general Government position to favor business over the private citizen, the FCC will tend to reallocate the RF space based on those priorities, regardless of how much the Amateur Radio world screams. Witness the reallocation of 220 MHz space.

I do not propose to cheapen the hobby by opening up ham bands to CB'ers as the doomsayers predict, but I do propose to take a more realistic look at how Amateur Radio fits into the "grand scheme" of things. The more parochial the ham community acts, the more we will be perceived as anachronisms whose loss will be mourned by few.

So, is there a College Ham club at University of Wisconsin / Oshkosh?
Or are they all members of Fox River Valley ARC?

I am a pilot and will be in Oshkosh this summer for the annual Experimental Aircraft Association meet July 27 - August 2. I would like a list of the local repeaters (published in the repeater directory or not) and access to the local phone patch for that week.

Assuming this actually reaches someone at UW/Oshkosh, I am also looking for a motorcycle or moped to rent for that week. We are flying in and staying at Gruenhagen for the week and don't want a car (too much hassle parking). I can demonstrate insurance and 20 years of motorcycle proficiency (and maybe trade an airplane ride?).

Please mail to me and I'll post a summary.

<<<< WARNING: Nocode opinion follows.... >>>>

I had promised myself that I wouldn't add to the noise on the nocode issue, but I've got to make one point: I am against the nocode proposal, but not because I think the CW test is a great screen, but it's the only one that exists at present. We have a written test scheme in which all the answers are printed in a book. Our tests are not tests of technical knowledge, they are tests of memorization ability only (short term memory at that). When I ask folks who are preparing for an upgrade exam if their intent is to understand the material or to "pass the test", the answer is always "pass the test of course". It's pretty sad when we have extra class licensees who don't understand even ohm's law, but they can (or could) tell you what the answers on the test were though. I for one, am very concerned what the final outcome will be if we eliminate the code requirement and still print all the answers in the manuals. I can only support a nocode proposal if it includes new written exams that are at least *somewhat* technically challenging. Maybe I'm paranoid, but when I listen to those guys on 27.405 to 28.000 (the "freeband"), I wonder how hard it will be for them to memorize a few answers...

Speaking of university clubs ...

The University of Texas at Austin ARC, W5EHM (W5 Echo [Hotel|Hike] Motel) as it exists today came about sometime in the 1950's. Although the club doesn't sport the tradition of a W8LT, W1XM/W1MX or W2SZ, it's been working at developing a legacy of its own. The focal point of club activities is operating both modes of the ARRL November Sweepstakes. The UT-Austin club is always gunning for national recognition by earning a spot in the MultiOperator Top Ten. Sometimes they make it, sometimes they don't.

Nonetheless, the W5EHM club counts among its alumni a motley collection of Sweepstakes enthusiasts who have learned what a great club activity an SS effort can be.

     I am curious about this statement, ie test is only that
     of memorization.  One data point, a guy I work with here, passed
     his general first shot.  He did not memorize the questions.  Is
     it the case that the various courses actually set out and train
     people to understand the material or to just memorize?  Or is
     the material hard enough that the average guy cannot absorb it and
     thus the courses evolve to the least common denominator?

Why the blank under License? Is this to imply that we don't have
licenses? (Why did I pay $13 for that yellow piece of paper?)
Yes, we have a no-code license, but you know that ...

>*  Much of the territory is unpopulated

Should be obvious from the numbers :-)

Excuse me? Either it exists or it doesn't. Don't be such a bigot.

I just phoned the Dep't of Communications. They don't have a
breakdown by certificate type available, however I going to
contact the licensing branch in Ottawa and put in a request
that they scan the license database and give me exact numbers.

Of course, all of this is moot, since all the digital certificate
holders grandfather into "advanced" status when the new licensing
system takes effect this fall.

[This means that current digital holders will inherit full HF
  privs - all modes - and will be able to operate CW (GASP!)
  without having to take THE DREADED MORSE TEST! I think you're
  going to see a LOT of people writing the digital exam over the
  summer :-)]

Just a comment on buying from Japan in general...

I was interested in buying a camera outfit and many suggested that mail-order was the way to go. I got myself a copy of a photographic magazine and the mail-order vendors listed in the back had prices that no one around here (OH) could come close to. What I didn't realize at the onset was that those prices were for Japanese goods. In other words, there was no U.S. warranty on it.
I was looking at Canon equipment. I found out that Canon has a subsidiary called U.S. Canon that does better (at least more!) quality control and maintains the warranty program. When comparing U.S. Canon prices (i.e. that contained a U.S. warranty) I found that their prices were still better although not anywhere as significantly better as Canon's. The warranty and cost of quality control made the difference.

My personal opinion is: Warranties are like insurance; you don't need them... until you need them. If you feel that you can live without the insurance then ordering direct is the best way to go. I went with the U.S. warranty.

I don't think it's a matter of "cannot absorb" it, I think it's a matter of the fastest way to meet your goal. If your goal is to simply "pass the test", then the fatest way to accomplish that it to memorize the questions and the answers. I think the ARRL manuals are pretty well written such that if even non-technical folks took the time to read and study them in order, they could easily understand the material and pass a fair test on that material. As long as we continue to print the question pools and the answers, there will always be an easier way out. I've talked to several folks who have never read any part of the license manuals other than the question pools. I don't see how taking away the code requirement and not "fixing" the written tests will benefit amateur radio. Sheer numbers cannot be the answer to everything that is wrong with our hobby.
